State-Space Search

Algorithms, Complexity,
Extensions, and Applications

With 51 Figures

Springer

Contents

1	State-Space Search for Problem Solving	1
1.1	Combinatorial Search Problems	2
1.1.1	Sliding-tile puzzles	2
1.1.2	The symmetric Traveling Salesman Problem	4
1.1.3	The asymmetric Traveling Salesman Problem	7
1.1.4	Maximum boolean satisfiability	9
1.2	Branch-and-Bound Methods	10
1.3	Bibliographical and Historical Remarks	11
2	Algorithms for Combinatorial Optimization	13
2.1	Algorithms for Optimal Solutions	14
2.1.1	State space	14
2.1.2	Cost function and heuristic evaluation	14
2.1.3	Best-first search	16
2.1.4	Depth-first branch-and-bound	18
2.1.5	Iterative deepening	19
2.1.6	Recursive best-first search	20
2.1.7	Space-bounded best-first search	23
2.2	Algorithms for Approximate Solutions	25
2.2.1	Approximation based on branch-and-bound	25
2.2.2	Local search	27
2.3	Bibliographical and Historical Remarks	31
3	Complexity of State-Space Search for Optimal Solutions	34
3.1	Incremental Random Trees	35

3.2	Problem Complexity and Cost of Optimal Goal	37
3.3	Best-First Search	40
3.4	Depth-First Branch-and-Bound	41
3.5	Iterative Deepening	45
3.6	Recursive and Space-Bounded Best-First Searches	51
3.7	Branching Factors	52
3.8	Summary of Search Complexity	57
3.9	Graphs Versus Trees	57
3.10	Bibliographical and Historical Remarks	58
4	Computational Complexity Transitions	61
4.1	Complexity Transition	62
4.1.1	Average-case complexity transition	62
4.1.2	Finding all optimal goals	63
4.1.3	Meaning of zero edge cost	63
4.2	Anomaly in Sliding-Tile Puzzles	67
4.3	Complexity Transition on the Asymmetric Traveling Salesman Problem	69
4.3.1	Complexity transitions on the asymmetric Traveling Salesman Problem	70
4.3.2	Identifying the order parameter	77
4.3.3	Summary	81
4.4	Bibliographical and Historical Remarks	82
5	Algorithm Selection	83
5.1	Comparison on Analytic Model	84
5.1.1	Node expansions	84
5.1.2	Running times	86
5.2	Comparison on Practical Problems	87
5.2.1	Lookahead search on sliding-tile puzzles	87
5.2.2	The asymmetric Traveling Salesman Problem	89
5.3	Summary	91
6	A Study of Branch-and-Bound on the Asymmetric Traveling Salesman Problem	92
6.1	Complexity of Branch-and-Bound Subtour Elimination	93
6.1.1	A debate over polynomial versus exponential complexity	93
6.1.2	Preliminaries	94
6.1.3	A study of the polynomial argument	96
6.1.4	Summary	103
6.2	Local Search for the Asymmetric Traveling Salesman Problem	104
6.3	Finding Initial Tours	106
6.3.1	Initial tour construction heuristics	107

6.3.2	Problem structures	108
6.3.3	Experimental comparison	108
6.4	Depth-First Branch-and-Bound Versus Local Search . . .	109
6.4.1	Truncated depth-first branch-and-bound versus local search	110
6.4.2	Anytime depth-first branch-and-bound versus local search	112
6.4.3	Discussion	114
6.4.4	Summary	114
6.5	Bibliographical and Historical Remarks	115
7	State-Space Transformation for Approximation and Flexible Computation	116
7.1	Anytime Approximation Computation	117
7.2	Flexible Computation	118
7.3	State-Space Transformation	120
7.4	Properties of State-Space Transformation	123
7.4.1	Effectiveness	123
7.4.2	Tradeoff between solution quality and computational complexity	124
7.5	Improvements and Extensions	126
7.5.1	Iterative ϵ -transformation	126
7.5.2	Actual-value pruning	128
7.6	Learning Edge-Cost Distribution and Branching Factor .	130
7.7	Experimental Results	132
7.7.1	Random trees	132
7.7.2	The asymmetric Traveling Salesman Problem . . .	136
7.7.3	Maximum boolean satisfiability	139
7.7.4	Summary	141
7.8	Bibliographical and Historical Remarks	142
8	Forward Pruning for Approximation and Flexible Computation, Part I: Single-Agent Combinatorial Optimization	144
8.1	Forward Pruning	145
8.1.1	Forward pruning	146
8.1.2	Complete forward pruning	146
8.1.3	Complete forward pruning for anytime search . . .	147
8.2	Domain-Independent Pruning Heuristics	148
8.2.1	When to prune a node	148
8.2.2	When not to prune a node	148
8.3	Forward Pruning as State-Space Transformation	149
8.4	Analyses	150
8.4.1	An analytic model	150
8.4.2	Probability of finding a solution	150
8.4.3	Modified pruning rule	156

8.4.4	Tradeoff between complexity and solution quality	161
8.4.5	Anytime features	163
8.5	Learning Edge-Cost Distribution and Setting Parameters	164
8.6	Experimental Results	165
8.6.1	Maximum boolean satisfiability	165
8.6.2	The symmetric Traveling Salesman Problem	167
8.6.3	The asymmetric Traveling Salesman Problem	168
8.7	Summary and Discussion	170
8.8	Bibliographical and Historical Remarks	170
9	Forward Pruning for Approximation and Flexible Computation,	
	Part II: Multiagent Game Playing	172
9.1	Minimax and Alpha-Beta Pruning	173
9.2	Forward Pruning	175
9.2.1	Bounds of minimax values	175
9.2.2	Domain-independent pruning heuristics	175
9.3	Playing Games	177
9.3.1	Random game trees	178
9.3.2	The game of Othello	178
9.4	Summary and Discussion	180
9.5	Bibliographical and Historical Remarks	181
A	Basic Concepts of Branching Processes	182
B	Mathematical Notation	185
C	List of Algorithms	186
	References	187
	Index	197
