

Geometry in Nature

Vagn Lundsgaard Hansen

*Mathematical Institute
The Technical University of Denmark
Lyngby, Copenhagen*

Translated by Tom Artin

A K Peters
Wellesley, Massachusetts

Contents

Preface to the English Edition ix

Preface xi

1. Geometric Forms in Nature 1

1. Spirals and the Wonderful Snail 2
2. The Helix and the Twining Vine 8
3. The Geometry of Soap Films 14
4. The Geometry of Tiled Surfaces 22
5. The Regular Polyhedra 29

2. The Topology of Surfaces 37

1. Some Familiar Surfaces 38
2. The Projective Plane and the Klein Bottle 41
3. What Is a Closed Surface? 46
4. Orientable and Non-Orientable Surfaces 51
5. Connected Sum of Closed Surfaces 53
6. Classification of Closed Surfaces 57
7. Higher-Dimensional Manifolds and Poincaré's Conjecture 63

3. The Topology of Catastrophes 71

1. The Origin of Catastrophe Theory 73
2. Singularities: Mappings of the Plane into the Plane 74
3. The Fold Catastrophe 76
4. The Cusp Catastrophe 78
5. Thom's Theorem for Systems with Two Control Variables and One State Variable 82
6. Some Applications of the Cusp Catastrophe 84
7. The Mathematics behind the Models of Catastrophe Theory 89
8. The Seven Elementary Catastrophes in Space-Time 99
9. Some General Remarks concerning Applications 103

4. Geometry and the Physical World 107

1. On Mathematics and Its Greek Legacy 109
2. Greek Astronomy and the Ptolemaic System 114
3. The Copernican World, Tycho Brahe and Kepler 128
4. The Breakthrough of Modern Natural Science 138
5. Newton and Gravitation 148

5. Geometry and Modern Physics 157

1. Maxwell and the Electromagnetic Theory 160
2. Einstein's Theory of Relativity 172
3. Minkowski Space-Time and the Special Theory of Relativity 180

Contents

4. Curvature and Gravitation: The General Theory of Relativity 189
5. The Physics of Elementary Particles 202
6. Fiber Bundles and Parallel Displacement in Fiber Bundles 207
7. Gauge Theories and String Theories 211

Epilogue 223

Bibliography 225

Index 231
