

Modern Mathematical Methods of Optimization

edited by Karl-Heinz Elster

Akademie Verlag

Contents

Introduction	15
1 Modern numerical methods and software in optimization	23
1.1 The linearization method in constrained optimization	23
1.1.1 Introduction	23
1.1.2 The essence of the method, its formulation and convergence conditions	24
1.1.3 Exact penalty functions	27
1.1.4 Selection of N and constructivity of convergence conditions	29
1.1.5 Local analysis	33
1.1.6 A linearization method with accelerated convergence	37
1.1.7 Some questions of implementation	39
1.2 Superlinearly convergent methods of nonlinear programming	43
1.2.1 Introduction	43
1.2.2 Local theory	43
1.2.3 Global theory	47
1.3 Optimization problems in the presence of noise	53
1.3.1 Sources and types of noise	53
1.3.2 Behaviour of standard methods in the presence of noise	54
1.3.3 Convergence of methods under random noise	55
1.3.4 Optimal methods	56
1.3.5 Generalizations	57
1.3.6 Implementable algorithms	59
1.3.7 Constrained minimization	60

1.3.8	Conclusion	61
1.4	Software for mathematical programming problems	61
	References	65
2	Optimal methods of convex programming and polynomial methods of linear programming	75
2.1	Local methods of convex programming. Optimal methods	75
2.1.1	Local methods	75
2.1.2	Complexity of convex problems	76
2.1.3	Cutting plane methods	77
2.1.4	Method of centres	78
2.1.5	Method of circumscribed ellipsoids	79
2.1.6	Method of inscribed ellipsoids	79
2.1.7	Constrained problems	81
2.2	Polynomial algorithms in linear programming	82
2.2.1	Algebraic statement of the problem	82
2.2.2	Bit posing. Method of ellipsoids	83
2.2.3	Karmarkar's method	84
2.2.4	The projection method	86
2.2.5	The methods of Renegar and Vaidya	89
2.2.6	Dual algorithms	91
2.3	Optimal methods for the solution of large-scale convex programming problems	97
2.3.1	Smooth spaces	98
2.3.2	General convex problems	99
2.3.3	Smooth convex problems	101
2.3.4	Problems with regular minimum	107
	References	111
	Additional References	114
3	Decomposition of optimization problems	116
3.1	Decomposition approach in optimization	116
3.1.1	Typical approaches	117

3.1.2	Generalizations	121
3.2	Convex problems with bordering structure	123
3.2.1	Statement of the problem	123
3.2.2	Primal decomposition with allocation of centralized resources	125
3.2.3	Simultaneous application of primal and dual decomposition	128
3.3	A general approach to the construction of decomposition (block) methods of convex programming	132
3.3.1	Statement of the problem	132
3.3.2	Description of the method	134
3.3.3	Discussion of the method	136
3.3.4	Decomposition method for the analysis of monotonic mappings	138
	References	142
4	Nonsmooth functions	146
4.1	Nonsmooth analysis and directional derivatives	146
4.1.1	Introduction	146
4.1.2	Approximation of functions	147
4.1.3	Dini derivatives	150
4.1.4	Clarke derivatives	152
4.1.5	Approximation of sets	155
4.1.6	Clarke's cone	158
4.2	Quasidifferentiable functions	159
4.3	Lexicographically smooth functions	164
4.3.1	The class of lexicographically smooth functions	164
4.3.2	Lexicographic derivatives and their properties	165
4.3.3	Fundamental theorem of lexicographic differential calculus	168
4.3.4	Examples of lexicographic derivatives	170
4.3.5	Some theorems from analysis	173
	References	174
5	Improper problems of mathematical programming	178
5.1	Introduction	178
5.2	Duality	180

5.2.1	Realization of duality for improper linear programming problems	181
5.2.2	Duality for improper convex programming problems of the first kind	187
5.2.3	On duality of improper problems in infinite-dimensional spaces	188
5.3	Infinite-dimensional linear programming problems with a duality gap	191
5.3.1	Approximation of an infinite-dimensional LP problem by cones	191
5.3.2	Infinite linear programming problems over R_∞	193
5.4	Correction of systems of linear equations and inequalities using additional information	195
5.5	Correction of improper minimax problems	198
5.5.1	Solvability sets	198
5.5.2	Correction according to a convex criterion	199
5.5.3	Correction with respect to a concave-convex criterion	201
5.6	Regularization of improper linear problems	203
5.7	Correction of improper convex programming problems by means of augmented Lagrangians	206
5.7.1	Correction on the basis of a modification of the Lagrangian with respect to dual variables	206
5.7.2	Correction on the basis of a symmetric modification of the Lagrangian	209
