# Transition Metal Chemistry

The Valence Shell in d-Block Chemistry

Weinheim · New York  
Basel · Cambridge · Tokyo

# Contents

## Preface

<b>1</b>	<b>An Introduction to Transition-Metal Chemistry . . . . .</b>	<b>1</b>
1.1	What is a Transition Element? . . . . .	1
1.2	Complexes and Coordination Compounds . . . . .	3
1.3	The Coordinate Bond . . . . .	5
1.4	Ligand Types . . . . .	5
1.5	Coordination Number . . . . .	8
1.6	Geometrical Types and Isomers . . . . .	9
1.7	Oxidation State . . . . .	12
1.8	Electroneutrality Principle . . . . .	14
1.9	Rationalization of Complex Geometries . . . . .	15
1.10	Review of Properties of Transition-Metal Compounds . . . . .	17
<b>2</b>	<b>Focus on the <math>d^n</math> Configuration . . . . .</b>	<b>21</b>
2.1	Spectral Features . . . . .	21
2.2	The Valence Shell . . . . .	23
2.3	The Roles of $d$ Electrons . . . . .	26
<b>3</b>	<b>Crystal-Field Splittings . . . . .</b>	<b>27</b>
3.1	The Crystal-Field Premise . . . . .	27
3.2	Splitting of $d$ Orbitals in Octahedral Symmetry . . . . .	28
3.3	Splitting of $d$ Orbitals in Tetrahedral and Other Symmetries . . . . .	32
3.4	Holes: $d^1$ and $d^9$ . . . . .	34
3.5	More Transitions for $d^2$ . . . . .	36
3.6	Atomic Orbitals and Terms . . . . .	40
3.7	Crystal-Field Splitting of Free-Ion $D$ Terms . . . . .	44
3.8	Crystal-Field Splitting of Free-Ion $F$ terms . . . . .	46
3.9	Free-ion $S$ and $P$ Terms in Crystal Fields . . . . .	48
3.10	Splitting Patterns for $d^n$ Ground terms . . . . .	52
3.11	Orgel Diagrams . . . . .	56
3.12	Concluding Remarks . . . . .	58

<b>4</b>	<b>The Intensities of ‘<i>d-d</i>’ Spectra . . . . .</b>	61	<b>8</b>
4.1	Transition Moments . . . . .	61	8.1
4.2	Selection Rules . . . . .	62	8.2
4.3	‘Violation’ of the Selection Rules . . . . .	64	8.2
4.4	Intensity ‘Stealing’ . . . . .	69	8.2
4.5	‘Two-Electron Jumps’ . . . . .	71	8.2
4.6	‘Spin-Flip’ Transitions . . . . .	72	8.3
4.7	The Effects of Temperature Change . . . . .	74	8.4
4.8	Summarizing Remarks . . . . .	76	8.4
			8.4
<b>5</b>	<b>Spin and Magnetism . . . . .</b>	77	8.4
5.1	High-Spin and Low-Spin Configurations . . . . .	77	8.5
5.2	The Qualitative Origin of Paramagnetism . . . . .	79	9
5.3	‘Orbital Quenching’ and the ‘Spin-Only’ Formula . . . . .	88	9.1
5.4	Orbital Contributions . . . . .	90	9.1
5.5	Orbital Contributions at the Strong-Field limit . . . . .	93	9.1
5.6	The Chemical Relevance of Departures from the Spin-Only Formula . . . . .	95	9.1
5.7	Summary . . . . .	96	9.
			9.
<b>6</b>	<b>Ligand Fields, Bonding and the Valence Shell . . . . .</b>	97	9.
6.1	The Nephelauxetic Effect . . . . .	97	9.
6.2	The Spectrochemical Series . . . . .	99	9.
6.3	Bonding in Octahedral Complexes . . . . .	102	9.
6.3.1	Molecular Orbitals in Diatomic Molecules . . . . .	102	9.
6.3.2	Molecular Orbitals in Polyatomic Molecules . . . . .	104	9.
6.3.3	Molecular Orbitals for the Water Molecule . . . . .	104	9.
6.3.4	The Molecular Orbital Diagram for Octahedral Complexes: Local M–L $\sigma$ Bonding . . . . .	108	9.
6.3.5	Charge-Transfer Transitions . . . . .	114	9.
6.3.6	Metal–Ligand $\pi$ Bonding . . . . .	114	9.
6.4	Ligand-Field Theory . . . . .	117	1
6.5	Synergic Back-Bonding . . . . .	121	1
6.6	Valence Shells in High and Low Oxidation States . . . . .	124	1
6.7	Electroneutrality and the Elasticity of the <i>d</i> Shell . . . . .	126	1
6.8	The Bonding Contributions of <i>d</i> Orbitals . . . . .	127	1
			1
<b>7</b>	<b>Steric Effects of Open <i>d</i> Shells . . . . .</b>	129	1
7.1	Bond Lengths in Octahedral Complexes . . . . .	129	1
7.2	Planar Coordination in <i>d</i> <sup>8</sup> Complexes . . . . .	131	1
7.3	Trigonal Bipyramidal Coordination . . . . .	135	1
7.4	The Jahn-Teller Effect . . . . .	137	1

61	<b>8 Complex Stability and Energetics</b>	145
61	8.1 The Thermodynamic Stability of Complexes	145
62	8.2 The Chelate Effect and Polydentate Ligands	146
64	8.2.1 Thermodynamic Origins of the Chelate Effect	147
69	8.2.2 Contributions to the Chelate Effect – The Enthalpy	148
71	8.2.3 Contributions to the Chelate Effect – The Entropy	149
72	8.3 Ligand-Field Stabilization Energies	149
74	8.4 Energy and Structural Consequences in Real Systems	152
76	8.4.1 Hydration Energies of Transition-Metal(II) Ions	152
77	8.4.2 Lattice Energies of $MCl_2$ Species	158
77	8.4.3 The Spinels	159
79	8.5 The Irving-Williams Series	161
79	<b>9 Chemical Consequences of the <i>d</i>-Electron Configuration</b>	167
88	9.1 Introduction	167
90	9.2 Coordination Number and Geometry	167
93	9.2.1 Coordination Numbers in Low Oxidation State Complexes	172
95	9.3 Ligand types – The Concept of Hard and Soft	173
96	9.4 The Stabilization of Oxidation States, and Reduction Potentials	176
97	9.4.1 Reduction Potentials and Thermodynamics	176
97	9.4.2 Intermediate Oxidation States	176
97	9.4.3 The Electroneutrality Principle – A Reprise	179
99	9.4.4 Protic Equilibria Involving Coordinated Ligands	181
02	9.4.5 The Stabilization of High Oxidation States	184
02	9.4.6 <i>d</i> Orbitals, Covalent Character and Variable Oxidation States – A Summary	184
04	9.5 Consequences of the <i>d</i> -Electron Configuration upon Reaction Rates	186
04	9.5.1 Kinetically Inert and Labile Complexes	186
04	9.5.2 Ligand Substitution Reactions	186
04	9.5.3 Rates of Electron Transfer Reactions	189
7	<b>10 The Lanthanoid Series</b>	197
1	10.1 The Lanthanoid Contraction	197
4	10.2 The Core-Like Behavior of <i>f</i> Electrons	198
6	10.3 Magnetic Properties in the <i>f</i> Block	199
7	10.4 Spectral Features	203
9	<b>Index</b>
