Preface ix

1 Causal Inference and the Language of Experimentation 1

- Introduction 1
- The Language of Experimentation 2
- The Concept of Cause 9
 - Causation and the Positivist Tradition* 10
 - Essentialist Theories of Causation* 14
 - John Stuart Mill and Causation* 18
 - Popper and Falsificationism* 20
 - The Activity Theory of Causation* 25
 - An Evolutionary Critical-Realist Perspective* 28
- Implications of the Analysis of Causation 30

2 Validity 37

- Statistical Conclusion Validity 39
 - Introduction 39
 - Some Major Threats to Statistical Conclusion Validity* 41
 - The Problem of "Accepting" the Null Hypothesis* 44
- Internal Validity 50
 - Introduction 50
 - Threats to Internal Validity* 51
 - Estimating Internal Validity in Randomized Experiments and Quasi-Experiments* 55
 - Threats to Internal Validity That Randomization Does Not Rule Out* 56
 - Assessing the Plausibility of Internal Validity Threats If a Randomized Experiment Has Been Implemented* 58
- Construct Validity of Putative Causes and Effects 59
 - Introduction 59
 - List of Threats to the Construct Validity of Putative Causes and Effects* 64
 - Construct Validity, Preexperimental Tailoring, and Postexperimental Specification* 68
- External Validity 70
 - Introduction 70
 - List of Threats to External Validity* 73
 - Models to Be Followed in Increasing External Validity* 74

Relationships Among the Four Kinds of Validity	80
<i>Internal Validity and Statistical Conclusion Validity</i>	80
<i>Construct Validity and External Validity</i>	81
<i>Issues of Priority Among Validity Types</i>	82
Some Objections to Our Validity Distinctions	85
Some Objections to Our Tentative Philosophy of the Social Sciences	91
3 Quasi-Experiments: Nonequivalent Control Group Designs	95
Notational System	95
Three Designs That Often Do Not Permit Reasonable Causal Inferences	95
<i>The One-Group Posttest-Only Design</i>	96
<i>The Posttest-Only Design with Nonequivalent Groups</i>	98
<i>The One-Group Pretest-Posttest Design</i>	99
Some Generally Interpretable Nonequivalent Control Group Designs	103
<i>The Untreated Control Group Design with Pretest and Posttest</i>	103
<i>The Nonequivalent Dependent Variables Design</i>	118
<i>The Removed-Treatment Design with Pretest and Posttest</i>	120
<i>The Repeated-Treatment Design</i>	123
<i>The Reversed-Treatment Nonequivalent Control Group Design with Pretest and Posttest</i>	124
<i>The Cohort Design in Formal and Informal Institutions with Cyclical Turnover</i>	126
<i>The Posttest-Only Design with Predicted Higher-Order Interactions</i>	134
<i>The Regression-Discontinuity Design</i>	137
4 The Statistical Analysis of Data from Nonequivalent Group Designs	147
Charles S. Reichardt	147
Introduction	147
Nonequivalent Group Designs Without Controlled Selection	148
<i>Elementary Analysis of Variance (ANOVA)</i>	150
<i>Analysis of Covariance (ANCOVA) with a Single Covariate</i>	153
<i>Analysis of Covariance with Multiple Covariates</i>	170
<i>Analysis of Variance with Blocking or Matching</i>	175
<i>Analysis of Variance with Gain Scores</i>	182
<i>Rationales for the Analysis</i>	185
<i>General Guidelines for Analyzing Data from Nonequivalent Groups Without Controlled Selection</i>	196
Analysis of the Regression-Discontinuity Design	202
5 Quasi-Experiments: Interrupted Time-Series Designs	207
Introduction	207
<i>Types of Effects</i>	208
Simple Interrupted Time Series	209
Interrupted Time Series with a Nonequivalent No-Treatment Control Group Time Series	214
Interrupted Time Series with Nonequivalent Dependent Variables	218
<i>Interrupted Time Series with Removed Treatment</i>	221
<i>Interrupted Time Series with Multiple Replications</i>	222
<i>Interrupted Time Series with Switching Replications</i>	223
Some Frequent Problems with Interrupted Time-Series Designs	225
<i>Gradual Rather Than Abrupt Interventions</i>	226
<i>Delayed Causation</i>	227
<i>“Short” Time Series</i>	228
<i>Limitations of Much Archival Data</i>	230

6 The Statistical Analysis of the Simple Interrupted Time-Series Quasi-Experiment

Leslie J. McCain and Richard McCleary 233

Introduction 233

The Problem with Ordinary Least Squares Regression 234

Autoregressive Integrated Moving Average (ARIMA) Models 235

The Deterministic and Stochastic Components of a Time Series 235

Defining ARIMA (p, d, q) 236

Noise Model Identification 240

Estimation of ϕ and θ Values 251

Diagnosis 251

ARIMA Seasonal Models 253

Multiplicative ARIMA Seasonal Models 253

Identifying the Seasonal Model 255

The Intervention Components 261

Abrupt, Constant Change 262

Gradual, Constant Change 263

Abrupt, Temporary Change 264

Which Transfer Function Should Be Used? 265

Summary of the Modeling Strategy 268

Identification 268

Estimation 268

Diagnosis 268

Intervention Hypothesis Test 269

Three Examples 270

The Effects of Charging for Calls to Directory Assistance 270

The Effects of a Flood on a Local Economy 278

The Effects of a Gun Control Law on the Incidence of Armed Robbery 282

Conclusion 292

7 Inferring Cause from Passive Observation 295

Treatment as a "Dummy Variable" in a Regression Analysis 298

Causal Modeling by Path Analysis 301

Cross-Lagged Panel Correlations 309

The Causal Analysis of Concomitancies in Time Series *Melvin M. Mark* 321

Ordinary Least Squares (OLS) Regression When Trend or Seasonality Is Present 321

OLS Regression When Trend and Seasonality Are Absent or Removed 324

Generalized Least Squares (GLS) Regression 326

Distributed Lag Models 327

The Simple Cross-Correlation Function 327

Prewhitening by the Presumed Cause 330

The Independent Prewhitening of Both Series 331

Spectral Analysis Methods 333

Some Generic Problems 335

Issues Not Addressed 338

Concluding Comments on Moving from Passive Observation to Deliberate Manipulation 339

8 The Conduct of Randomized Experiments 341

Introduction 341

The Functions of Random Assignment 341

What Random Assignment Does Not Do 342

When Random Assignment Is Not Feasible or Desirable 344

This Chapter 346

Major Obstacles to Conducting Randomized Experiments in Field Settings	347
<i>Withholding the Treatment from No-Treatment Control Groups</i>	347
<i>Faulty Randomization Procedures</i>	350
<i>Sampling Variability and the Number and Choice of Units for Randomization</i>	354
<i>Treatment-Related Refusals to Participate in the Planned Experiment</i>	356
<i>Treatment-Related Attrition from the Experiment</i>	359
<i>Heterogeneity in the Extent of Treatment Implementation</i>	366
<i>The Treatment in the No-Treatment Control Group</i>	367
<i>Unobtrusive Treatment Implementation</i>	369
Situations Conducive to Randomized Experiments	371
<i>When Lotteries Are Expected</i>	372
<i>When Demand Outstrips Supply</i>	374
<i>When an Innovation Cannot Be Delivered in All Units at Once</i>	375
<i>When Experimental Units Can Be Temporarily Isolated: The Equivalent Time Samples Design</i>	377
<i>When Experimental Units Are Spatially Separated or Interunit Communication Is Low</i>	378
<i>When Change Is Mandated and Solutions Are Acknowledged to Be Unknown</i>	380
<i>When a Tie Can Be Broken</i>	381
<i>When Some Persons Express No Preference Among Alternatives</i>	381
<i>When You Can Create Your Own Organization</i>	382
<i>When You Have Control over Experimental Units</i>	383
Conclusion	384
