

CONTENTS

Introduction	1
1. First step: flatness in the Berkovich setting	1
2. Loci of validity	5
3. About our proofs	8
Acknowledgements	11
1. Background material	13
1.1. Prerequisites and basic conventions	13
1.2. Analytic geometry: basic definitions	16
1.3. Coherent sheaves, Zariski topology and closed immersions	20
1.4. Dimension theory	25
1.5. Irreducible components	29
2. Algebraic properties in analytic geometry	35
2.1. Analytification of schemes, algebraic properties of analytic rings	36
2.2. A rather abstract categorical framework	39
2.3. Formalisation of algebraic properties	42
2.4. Validity in analytic geometry	47
2.5. Fibers of coherent sheaves	50
2.6. Ground field extension	52
2.7. Complements on analytifications	55
3. Germs, Temkin's reduction and Γ-strictness	63
3.1. Γ -strictness	64
3.2. Analytic germs	66
3.3. Around graded Riemann-Zariski spaces	69
3.4. Temkin's construction	72
3.5. Temkin's reduction and Γ -strictness	75

4. Flatness in analytic geometry	83
4.1. Naive and non-naive flatness	84
4.2. Algebraic flatness <i>versus</i> analytic flatness	88
4.3. The flat, (locally) finite morphisms	91
4.4. Naive flatness is not preserved by base change	93
4.5. Analytic flatness has the expected properties	97
5. Quasi-smooth morphisms	105
5.1. Reminders about the sheaf of relative differentials	106
5.2. Quasi-smoothness: definition and first properties	108
5.3. Quasi-smoothness, flatness and fiberwise geometric regularity	112
5.4. Links with étale and smooth morphisms	116
5.5. Transfer of algebraic properties	121
6. Generic fibers in analytic geometry	125
6.1. Preliminary lemmas	127
6.2. Relative polydiscs inside relative smooth spaces	129
6.3. Local rings of generic fibers	134
7. Images of morphisms: local results	141
7.1. Maps between Riemann-Zariski Spaces: the non-graded case	142
7.2. Maps between Riemann-Zariski spaces: the general case	144
7.3. Applications to analytic geometry	149
7.4. Complement: around quantifier elimination in the theory ACVF	152
8. Dévissages à la Raynaud-Gruson	157
8.1. Universal injectivity and flatness	158
8.2. Dévissages: definition and existence	164
8.3. Flatness can be checked naively in the inner case	170
8.4. The relative CM property	172
9. Quasi-finite multisections and images of maps	175
9.1. Flat, quasi-finite multisections of flat maps	177
9.2. Images of maps	184
10. Constructible loci	187
10.1. Constructibility in analytic spaces	188
10.2. The diagonal trick	193
10.3. The flat locus	200
10.4. The fiberwise closure of a locally constructible set	203
10.5. The fiberwise exactness locus	209
10.6. Regular sequences	215
10.7. The main theorem	217

11. Algebraic properties: target, fibers and source	229
11.1. A weak “dominant factorization theorem”	230
11.2. The axiomatic setting	233
11.3. The main theorem	235
A. Graded commutative algebra	241
A.1. Basic definitions	241
A.2. Graded linear algebra	243
A.3. Graded algebras and graded extensions	245
A.4. Graded valuations	248
Index of notation	253
Index	255
Bibliography	259
