Volumes I and II

Author's preface to the English edition	x
Preface to the second edition	xi
Notation	xii
References to volumes I and II	xiii
Index to volumes I and II	xxiii

Volume I

1. Hilbert space	1
1. Linear systems	1
2. Linear manifolds	2
3. The scalar product (inner product)	4
4. Some general concepts	7
5. Hilbert space	8
6. Distance of a point from a convex set in H	12
7. Projection of a vector on to a sub-space	14
8. Orthogonalization of a sequence of vectors	19
9. Bessel's inequality and Parseval's equation	21
10. Complete orthonormal systems of vectors in H	27
11. The space L^2	32
12. Complete orthonormal sequences in L^2	36
13. Bi-orthogonal systems of vectors in H	40
14. The space L^2_σ	43
15. The space of almost-periodic functions	49
16. The concept of a basis of a space	50
2. Linear functionals and bounded linear operators	56
17. Point-functions	56
18. Linear functionals	58
19. A theorem of F. Riesz	60
20. A criterion for a given system of vectors to be closed in H	63
21. A lemma on convex functionals	64

22. Bounded linear operators	67
23. Bilinear functionals	69
24. The general form of a bilinear functional	71
25. Adjoint operators	73
26. Weak convergence in H	77
27. Compactness	79
28. A criterion for an operator to be bounded	82
29. Linear operators in a separable space	82
30. Completely continuous operators (compact operators)	88
31. Absolute norms	91
32. Hilbert–Schmidt operators	95
33. Convergent sequences of bounded linear operators	97
34. Sets of bounded linear operators in a separable Hilbert space	99
3. Projection operators and unitary operators	103
35. Definition of a projection operator	103
36. Properties of projection operators	104
37. Operations on projection operators	105
38. Sequences of projection operators	108
39. The aperture of two linear manifolds	109
40. Unitary operators	112
41. Isometric operators	114
42. The Fourier–Plancherel operator	116
4. General concepts and theorems in the theory of linear operators	120
43. Closed operators	120
44. General definition of an adjoint operator	121
45. Eigenvectors, invariant sub-spaces, and the reducibility of linear operators	124
46. Symmetric operators	128
47. More about isometric and unitary operators	131
48. The concept of the spectrum	132
49. The resolvent	136
50. Conjugation operators	139
51. The graph method	141
52. A generalization of the concept of a projection operator	145
53. Matrix representation of unbounded symmetric operators	147
54. The operator of multiplication by the independent variable	152
55. The operator of differentiation	156

5. Spectral analysis of completely continuous operators	164
56. Two lemmas	164
57. On the eigenvalues of completely continuous operators in \mathbb{R}	166
58. Fredholm theorems for completely continuous operators	170
59. F. Riesz's method in the theory of linear functional equations	173
60. Completely continuous self-adjoint operators in \mathbb{R}	178
61. Completely continuous, normal operators	183
62. Application to the theory of almost-periodic functions	186
63. Expansion of an arbitrary completely continuous operator as a series of one-dimensional operators	193
64. Nuclear operators	196
65. Schauder's fixed-point theorem	202
66. A theorem on the existence of an invariant sub-space for any completely continuous operator, and a generalization	208
6. Spectral analysis of unitary and self-adjoint operators	212
67. The resolution of the identity	212
68. The trigonometrical problem of moments	215
69. Analytic functions with values lying in a half-plane	218
70. The Bochner–Khinchin theorem	224
71. The spectral resolution of a unitary operator	228
72. Stieltjes-integral operators	233
73. Integral representation of a group of unitary operators	239
74. Integral representation of the resolvent of a self-adjoint operator	241
75. Spectral resolution of self-adjoint operators	247
76. On sets of operator-measure zero in a separable space	253
77. Functions of unitary operators	256
78. Direct derivation of the spectral resolution of a unitary operator	261
79. The Cayley transform	264
80. Commutative operators	269
81. Spectral resolution of bounded normal operators	270
82. The spectrum of a self-adjoint operator and of a unitary operator	272
83. The simple spectrum	277
84. Spectral types	283
85. The multiple spectrum	286
86. Canonical form of a self-adjoint operator with a spectrum of finite multiplicity	288

87. Unitary invariants of self-adjoint operators	292
88. General definition of functions of self-adjoint operators	294
89. Examples	296
90. Rings of bounded, self-adjoint operators	303
91. A characteristic property of functions of a self-adjoint operator	308
92. A theorem on the generating operator	312
 Volume II	
7. The spectrum and perturbations of self-adjoint operators	313
93. The continuous spectrum of a self-adjoint operator	313
94. H. Weyl's theorem and von Neumann's theorem on completely continuous perturbations	317
95. The absolutely continuous part and the singular part of the spectrum	325
96. Invariance of the absolutely continuous part of the spectrum relative to finite-dimensional perturbations	327
97. Definition and formal properties of wave operators	332
98. Existence of wave operators in the case of finite-dimensional perturbations	337
99. Transition to the general case of nuclear perturbations	341
8. Theory of extensions of symmetric operators	347
100. Deficiency indices	347
101. More about the Cayley transform	351
102. The von Neumann formulae	354
103. Simple symmetric operators	357
104. The structure of maximal operators	360
105. The spectra of self-adjoint extensions of a given symmetric operator	364
106. M. G. Krein's formula for the resolvents of self-adjoint extensions of a given symmetric operator	367
107. Self-adjoint extensions of semi-bounded operators	372
108. Norm-preserving, self-adjoint extensions of a bounded symmetric operator whose domain is not dense in H	376
109. Self-adjoint extensions of a semi-bounded symmetric operator which preserve its lower bound	382
9. Generalized extensions and generalized spectral functions of symmetric operators	388
110. Generalized resolutions of the identity. M. A. Naimark's theorem	388

111. Self-adjoint extensions with emergence from the space. Spectral functions of symmetric operators	393
112. Spectral functions of a symmetric operator and generalized resolvents	400
113. M. G. Krein's formula for generalized resolvents	406
114. Quasi-self-adjoint extensions and the characteristic function of a symmetric operator	413
115. On triangular resolutions of certain non-self-adjoint operators	428
Appendix 1. Integral operators	435
116. Definitions and auxiliary results	435
117. Example	440
118. Spectral functions of an integral operator with a Carleman kernel	444
119. Spectral representation of a Carleman kernel	453
120. Generalization of the Hilbert-Schmidt formula	457
121. Characteristic properties of Carleman integral operators	458
122. Von Neumann's theorem	462
Appendix 2. Differential operators	468
123. Self-adjoint differential expressions	468
124. Regular differential operators	473
125. Self-adjoint extensions of a regular differential operator	475
126. Singular differential operators	481
127. Self-adjoint extensions of a singular differential operator	486
128. Resolvents of self-adjoint extensions	489
129. Inversion formulae associated with second-order differential operators	500
130. Generalization to differential operators of any order	515
131. Analysis of the nature of the spectrum of a differential operator by the decomposition method	519
132. Examples	530
