

Contents

1	Introduction	1
1.1	A short history of computer simulation	1
1.2	Computer simulation: motivation and applications	4
1.3	Model systems and interaction potentials	5
1.4	Constructing an intermolecular potential from first principles	25
1.5	Force fields	29
1.6	Studying small systems	35
2	Statistical mechanics	46
2.1	Sampling from ensembles	46
2.2	Common statistical ensembles	52
2.3	Transforming between ensembles	58
2.4	Simple thermodynamic averages	60
2.5	Fluctuations	66
2.6	Structural quantities	69
2.7	Time correlation functions and transport coefficients	73
2.8	Long-range corrections	79
2.9	Quantum corrections	81
2.10	Constraints	83
2.11	Landau free energy	85
2.12	Inhomogeneous systems	86
2.13	Fluid membranes	90
2.14	Liquid crystals	92
3	Molecular dynamics	95
3.1	Equations of motion for atomic systems	95
3.2	Finite-difference methods	97
3.3	Molecular dynamics of rigid non-spherical bodies	106
3.4	Constraint dynamics	113
3.5	Multiple-timestep algorithms	120
3.6	Checks on accuracy	121
3.7	Molecular dynamics of hard particles	125
3.8	Constant-temperature molecular dynamics	130
3.9	Constant-pressure molecular dynamics	140
3.10	Grand canonical molecular dynamics	144
3.11	Molecular dynamics of polarizable systems	145
4	Monte Carlo methods	147
4.1	Introduction	147
4.2	Monte Carlo integration	147

4.3	Importance sampling	151
4.4	The Metropolis method	155
4.5	Isothermal–isobaric Monte Carlo	160
4.6	Grand canonical Monte Carlo	164
4.7	Semi-grand Monte Carlo	168
4.8	Molecular liquids	169
4.9	Parallel tempering	177
4.10	Other ensembles	183
5	Some tricks of the trade	185
5.1	Introduction	185
5.2	The heart of the matter	185
5.3	Neighbour lists	193
5.4	Non-bonded interactions and multiple timesteps	200
5.5	When the dust has settled	201
5.6	Starting up	204
5.7	Organization of the simulation	210
5.8	Checks on self-consistency	214
6	Long-range forces	216
6.1	Introduction	216
6.2	The Ewald sum	217
6.3	The particle–particle particle–mesh method	224
6.4	Spherical truncation	231
6.5	Reaction field	235
6.6	Fast multipole methods	239
6.7	The multilevel summation method	243
6.8	Maxwell equation molecular dynamics	247
6.9	Long-range potentials in slab geometry	250
6.10	Which scheme to use?	254
7	Parallel simulation	258
7.1	Introduction	258
7.2	Parallel loops	260
7.3	Parallel replica exchange	262
7.4	Parallel domain decomposition	265
7.5	Parallel constraints	269
8	How to analyse the results	271
8.1	Introduction	271
8.2	Liquid structure	272
8.3	Time correlation functions	274
8.4	Estimating errors	281
8.5	Correcting the results	289
9	Advanced Monte Carlo methods	297
9.1	Introduction	297
9.2	Estimation of the free energy	298

9.3	Smarter Monte Carlo	317
9.4	Simulation of phase equilibria	333
9.5	Reactive Monte Carlo	338
10	Rare event simulation	342
10.1	Introduction	342
10.2	Transition state approximation	343
10.3	Bennett–Chandler approach	345
10.4	Identifying reaction coordinates and paths	346
10.5	Transition path sampling	347
10.6	Forward flux and transition interface sampling	350
10.7	Conclusions	354
11	Nonequilibrium molecular dynamics	355
11.1	Introduction	355
11.2	Spatially oscillating perturbations	357
11.3	Spatially homogeneous perturbations	361
11.4	Inhomogeneous systems	370
11.5	Flow in confined geometry	371
11.6	Nonequilibrium free-energy measurements	376
11.7	Practical points	379
11.8	Conclusions	381
12	Mesoscale methods	382
12.1	Introduction	382
12.2	Langevin and Brownian dynamics	383
12.3	Brownian dynamics, molecular dynamics, and Monte Carlo	387
12.4	Dissipative particle dynamics	390
12.5	Multiparticle collision dynamics	392
12.6	The lattice-Boltzmann method	394
12.7	Developing coarse-grained potentials	397
13	Quantum simulations	406
13.1	Introduction	406
13.2	<i>Ab-initio</i> molecular dynamics	408
13.3	Combining quantum and classical force-field simulations	420
13.4	Path-integral simulations	426
13.5	Quantum random walk simulations	437
13.6	Over our horizon	442
14	Inhomogeneous fluids	446
14.1	The planar gas–liquid interface	446
14.2	The gas–liquid interface of a molecular fluid	462
14.3	The liquid–liquid interface	464
14.4	The solid–liquid interface	464
14.5	The liquid drop	469
14.6	Fluid membranes	475
14.7	Liquid crystals	479

Appendix A Computers and computer simulation	481
A.1 Computer hardware	481
A.2 Programming languages	482
A.3 Fortran programming considerations	483
Appendix B Reduced units	487
B.1 Reduced units	487
Appendix C Calculation of forces and torques	491
C.1 Introduction	491
C.2 The polymer chain	491
C.3 The molecular fluid with multipoles	494
C.4 The triple-dipole potential	496
C.5 Charged particles using Ewald sum	497
C.6 The Gay–Berne potential	498
C.7 Numerically testing forces and torques	500
Appendix D Fourier transforms and series	501
D.1 The Fourier transform	501
D.2 Spatial Fourier transforms and series	502
D.3 The discrete Fourier transform	504
D.4 Numerical Fourier transforms	505
Appendix E Random numbers	509
E.1 Random number generators	509
E.2 Uniformly distributed random numbers	510
E.3 Generating non-uniform distributions	511
E.4 Random vectors on the surface of a sphere	514
E.5 Choosing randomly and uniformly from complicated regions	515
E.6 Generating a random permutation	516
Appendix F Configurational temperature	517
F.1 Expression for configurational temperature	517
F.2 Implementation details	517
List of Acronyms	521
List of Greek Symbols	527
List of Roman Symbols	529
List of Examples	533
List of Codes	534
Bibliography	536
Index	622
