<i>Introduction</i>	xiii
First Part	1
1. A short scrapbook on classical black holes	3
1.1 Mathematical black holes	3
1.2 Schwarzschild and Kerr black holes	6
1.2.1 The Schwarzschild black hole	6
1.2.2 The Kerr black hole	10
1.3 Bifurcate Killing horizons	15
1.4 Quantum fields and particles	19
1.4.1 The Boulware state	20
1.4.2 The Hartle-Hawking state	21
1.4.3 The Unruh state	22
1.5 BMS group for asymptotically flat spacetimes	23
1.6 Further readings	26
2. The seminal paper	27
2.1 Particle creation by black holes: The computation	31
2.2 Particle creation by black holes: Dependence on the details	45
2.2.1 Nonsymmetrical collapse	45
2.2.2 The spin of the fields	47
2.2.3 Massive fields	48
2.2.4 Angular momentum	49
2.2.5 Electric charge	50
2.2.6 Back reaction	51

2.3	A very short list of further readings	55
3.	Thermality of Hawking radiation: From Hartle-Hawking to Israel and Unruh	57
3.1	Hartle-Hawking approach to black hole radiance	58
3.2	Gibbons-Perry analysis for thermality	64
3.3	Thermofield dynamics and Hartle-Hawking-Israel state	66
3.3.1	Thermofield Dynamics	66
3.3.2	Israel contribution	68
3.4	Unruh's cornerstone	71
4.	The tunneling approach	73
4.1	Damour-Ruffini	74
4.2	Hamilton-Jacobi tunneling method	76
4.2.1	Canonical invariance	78
4.2.2	The null geodesic method	78
4.2.3	The analyticity argument	81
4.2.4	A trick à la Nikishov	83
4.2.5	The 4D case: Role of the transverse coordinates	86
4.3	Parikh-Wilczek approach	87
5.	The anomaly route to Hawking radiation	89
5.1	Christensen-Fulling way (1977)	89
5.2	Robinson-Wilczek (2005) and Iso-Umetsu-Wilczek (2006)	93
6.	The Euclidean section and Hawking temperature	101
6.1	Local diffeomorphism and extendability	102
6.2	Conical singularity and black hole horizon	104
6.2.1	The 2D case	104
6.2.2	The 4D case	105
6.3	The Hawking temperature from the extendability of the metric at $r = r_+$	106
6.4	Example: Schwarzschild black hole	108
6.5	The failure of the argument for extremal black holes	108
7.	Rigorous aspects of Hawking radiation	111
7.1	Local definiteness principle and local stability	112
7.1.1	The local definiteness	113

7.2	Hawking temperature from local definiteness and stability	115
7.3	Existence of Hartle-Hawking state	120
7.3.1	Almost free double quantum dynamical systems	120
7.3.2	The Minkowski vacuum	124
7.3.3	The Hartle-Hawking state	127
7.3.4	The Boulware one particle structure	129
7.4	Hawking temperature for a spacetime with bifurcated Killing horizon	131
7.4.1	Modular inclusion and Hawking temperature	131
7.5	Further readings for black holes of the Kerr-Newman family	133

Second Part 135

8.	The roots of analogue gravity	137
8.1	Experimental black hole evaporation in water	138
8.2	Analogue systems and dispersion: The Gospel according to Unruh	141
8.3	A sample model for dispersive fluids: Essentials	144
8.4	Analogue gravity in BEC	147
8.5	Further readings concerning analogue gravity in presence of dispersion	150
9.	Hawking radiation in a non-dispersive nonlinear Kerr dielectric	153
9.1	Classical analysis of the effective spacetime geometry	154
9.1.1	Wave rays geometry in the RIP frame	157
9.1.2	Horizons in effective geometries	159
9.1.3	Null geodesics in dispersionless and in dispersive dielectrics	163
9.1.4	Trapping in dispersive regime	168
9.2	Hawking radiation in a static dielectric black hole	170
9.2.1	The “standard” Hawking prediction	175
9.2.2	The electrodynamics point of view	177
9.3	Effects of optical dispersion: Preliminary heuristics	185
9.3.1	Horizons in dispersive media	188

10.	Hawking radiation in a dispersive Kerr dielectric	195
10.1	The relativistic Hopfield model	196
10.1.1	The covariant generalization of the Hopfield model	197
10.1.2	Quantum covariant Hopfield model	199
10.2	Uniformly moving RIP	214
10.3	Hawking radiation in the perturbative formulation	216
10.3.1	The $\varphi\psi$ -model	217
10.3.2	Separation of variables	220
10.3.3	Quantization of the fields	221
10.4	An interlude: Semi-analytical and numerical calculations from Maxwell equations in the lab	228
10.4.1	Born approximation	229
10.4.2	Thermality for a Gaussian perturbation	231
10.4.3	A sample of numerical results	233
10.5	Calculation of thermality in the $\phi\psi$ model	234
10.5.1	Determination of the microscopic parameters in terms of the physical ones	236
10.5.2	Near horizon approximation: Solutions of equation (10.232)	237
10.5.3	Steepest descent approximation	238
10.5.4	Convergence regions	241
10.5.5	Decreasing mode inside the black hole $x < 0$	241
10.5.6	Possible diagrams in the external region $x > 0$	241
10.5.7	Special configurations and thermality of pair-creation	242
10.5.8	Branch cuts along steepest descent paths	245
10.5.9	Vertical branch cuts	246
10.5.10	Near horizon: A different saddle point approximation	249
10.5.11	WKB solutions	252
10.5.12	A dimensionless parameter for the saddle point approximation	255
10.5.13	A further rescaling and insights for thermality	257
10.5.14	Coalescence of branch points as $\omega \rightarrow 0$	259
10.5.15	Horizons and dispersion	261
10.6	Recapitulation	263
10.7	Further readings	264
10.8	Hawking radiation in a dispersive nonlinear dielectric	265

11. Hawking radiation in the lab	267
11.1 The Como experiment	267
11.2 The Vancouver experiment	276
11.3 The Technion experiment	278
Appendix A Algebraic methods in QFT	281
A.1 Araki-Haag-Kastler algebraic formulation of QFT	281
A.2 Haag-Hugenholtz-Winnik formulation of quantum statistical systems	286
A.2.1 Structure of the statistical system	286
A.2.2 The Gibbs states	289
A.2.3 KMS condition and the infinite volume limit	290
A.2.4 The thermal representations	292
A.3 The Tomita-Takesaki theorem	294
A.3.1 Polar decomposition	294
A.3.2 Some simple facts about Von Neumann algebras	295
A.3.3 The Tomita-Takesaki theorem and the KMS condition	297
<i>Bibliography</i>	299
<i>Index</i>	321
