Preface — IX

Part I: Dynamical Systems

- 1 Linear Systems — 3**
 - 1.1 Eigenvector Approach — 3
 - 1.2 Matrix Exponentials — 11
 - 1.3 Matrix Representation of Solutions — 15
 - 1.4 Stability Theory — 24
 - 1.5 Fundamental Matrix Solutions — 28
 - 1.6 Nonhomogeneous and Nonautonomous Systems — 35
 - 1.7 Application: Linear Control Theory — 41

- 2 Linearization of Trajectories — 45**
 - 2.1 Introduction and Numerical Simulation — 45
 - 2.2 Linearization of Trajectories — 47
 - 2.3 Stability of Trajectories — 50
 - 2.4 Lyapunov Exponents — 51
 - 2.5 Linearization and Stability of Fixed Points — 56
 - 2.6 Dynamical Systems in Mechanics — 66
 - 2.7 Application: Elementary Astrodynamics — 68
 - 2.8 Application: Planar Circular Restricted Three-Body Problem — 71

- 3 Invariant Manifolds — 81**
 - 3.1 Asymptotic Behavior of Trajectories — 81
 - 3.2 Invariant Manifolds in \mathbb{R}^n — 85
 - 3.3 Stable Manifold Theorem — 88
 - 3.4 Contraction Mapping Theorem — 92
 - 3.5 Graph Transform Method — 95
 - 3.6 Center Manifold Theory — 101
 - 3.7 Application: Stability in Rigid-Body Dynamics — 105

- 4 Periodic Orbits — 111**
 - 4.1 Summation Notation — 111
 - 4.2 Poincaré Maps — 112
 - 4.3 Poincaré Reduction of the State-Transition Matrix — 116
 - 4.4 Invariant Manifolds of Periodic Orbits — 119
 - 4.5 Families of Periodic Orbits — 121

- 4.6 Floquet Theory — 122
- 4.7 Application: Periodic Orbit Families in the Hill Problem — 126

- 5 Bifurcations and Chaos — 131**
- 5.1 Poincaré–Bendixson Theorem — 131
- 5.2 Bifurcation and Hysteresis — 134
- 5.3 Period Doubling Bifurcations — 138
- 5.4 Chaos — 141
- 5.5 Application: Billiards — 143

Part II: Geometric Mechanics

- 6 Differentiable Manifolds — 151**
- 6.1 Differentiable Manifolds — 151
- 6.2 Vectors on Manifolds — 153
- 6.3 Mappings — 158
- 6.4 Vector Fields and Flows — 159
- 6.5 Jacobi–Lie Bracket — 161
- 6.6 Differential Forms — 167
- 6.7 Riemannian Geometry — 170
- 6.8 Application: The Foucault Pendulum — 177
- 6.9 Application: General Relativity — 179

- 7 Lagrangian Mechanics — 183**
- 7.1 Hamilton’s Principle — 183
- 7.2 Variations of Curves and Virtual Displacements — 186
- 7.3 Euler–Lagrange Equation — 188
- 7.4 Distributions and Frobenius’ Theorem — 192
- 7.5 Mechanical Systems with Holonomic Constraints — 195
- 7.6 Nonholonomic Mechanics — 196
- 7.7 Application: Nöther’s Theorem — 208

- 8 Hamiltonian Mechanics — 213**
- 8.1 Legendre Transform — 213
- 8.2 Hamilton’s Equations of Motion — 216
- 8.3 Hamiltonian Vector Fields and Conserved Quantities — 218
- 8.4 Routh’s Equations — 222
- 8.5 Symplectic Manifolds — 224
- 8.6 Symplectic Invariants — 229
- 8.7 Application: Optimal Control and Pontryagin’s Principle — 234
- 8.8 Application: Symplectic Probability Propagation — 240

9	Lie Groups and Rigid-Body Mechanics — 243
9.1	Lie Groups and Their Lie Algebras — 243
9.2	Left Translations and Adjoints — 248
9.3	Euler–Poincaré Equation — 253
9.4	Application: Rigid-Body Mechanics — 256
9.5	Application: Linearization of Hamiltonian Systems — 267
10	Moving Frames and Nonholonomic Mechanics — 271
10.1	Quasivelocities and Moving Frames — 271
10.2	A Lie Algebra Bundle — 274
10.3	Maggi’s Equation — 277
10.4	Hamel’s Equation — 279
10.5	Relation between the Hamel and Euler–Poincaré Equations — 289
10.6	Application: Constrained Optimal Control — 291
11	Fiber Bundles and Nonholonomic Mechanics — 297
11.1	Fiber Bundles — 298
11.2	The Transpositional Relation and Suslov’s Principle — 302
11.3	Voronets’ Equation — 305
11.4	Combined Hamel–Suslov Approach — 309
11.5	Application: Rolling-Without-Slipping Constraints — 313
	Bibliography — 321
	Index — 333
