Contents

Preface IX

Author's preface XI

Introduction 1

1. **Origin of catastrophe theory** 5
   1.1 Philosophy 5
   1.2 Mathematics 7
   1.3 Experiment 12
   1.4 Summary 21
   1.5 Evolution of catastrophe theory and its founders 23
References 24

2. **Elementary catastrophe theory** 27
   2.1 Introduction 27
   2.2 Potential functions of one variable 29
      2.2.1 Introduction 29
      2.2.2 Local properties of a function of one variable 30
      2.2.3 Structural stability of critical points 32
      2.2.4 Catastrophes described by Thom potential functions of one variable . 40
      2.2.5 Summary 46
   2.3 Functions of two variables 46
      2.3.1 Introduction 46
      2.3.2 Regular points of potential functions 49
      2.3.3 Morse lemma 51
      2.3.4 Splitting lemma 55
      2.3.5 Functions having degenerate critical points 57
      2.3.6 Elementary catastrophes for functions of two variables 61
   2.4 Final remarks 65
Appendix 66
   A2.1 Introduction 66
   A2.2 Elements of codimension theory 67
   A2.3 Summary 75
References 75

3. **Applications of elementary catastrophe theory (non-chemical systems)** 77
   3.1 Introduction 77
   3.2 Stability of soap films 77
   3.3 Thermodynamics and phase transitions 84

3.3.1 Classification of phase transitions 84
3.3.2 The liquid-vapour phase transition 86
3.3.3 Application of elementary catastrophe theory to a description of the liquid-vapour transition 89
3.4 Diffraction catastrophes 94
3.4.1 Introduction 94
3.4.2 The short-wave limit for the Helmholtz equation 96
3.4.3 The short-wave limit for the Schrödinger equation 103
3.4.4 Examples of higher-order diffraction catastrophes 106
3.4.5 Computation of oscillatory integrals 108
3.5 The Zeeman models for the heartbeat and the nerve impulse transmission 109
3.6 Population models and sequential models 117
3.6.1 Introduction 117
3.6.2 Analysis of a logistic sequential process 119
3.7 Relation of the discussed models to chemical systems 122
References 124

4. **Chemical kinetics** 125
4.1 Introduction 125
4.2 Fundamental concepts of chemical kinetics 127
4.3 Kinetic equations for reactions without diffusion 131
4.3.1 Examples of kinetic equations without diffusion 131
4.3.2 Standard kinetic systems 134
4.4 Kinetic equations for reactions with diffusion 136
4.5 Modelling of the reaction mechanisms by standard kinetic systems 137
4.5.1 Introduction 137
4.5.2 Fundamentals of the Tikhonov's method of reduction of kinetic equations 138
4.5.3 Tikhonov theorem 139
4.5.4 Application of the Tikhonov theorem to modelling of dynamical systems and chemical reactions 140
4.5.5 Slow dynamical systems and chemical kinetics equations 144
References 145

5. **Catastrophes in dynamical systems** 147
5.1 Introduction 147
5.2 Classification of linear systems 148
5.3 Non-linear dynamical systems 156
5.3.1 The Grobman-Hartman theorem 156
5.3.2 Limit sets 158
5.4 Fundamentals of catastrophe theory of dynamical systems 161
5.4.1 Definition of a catastrophe of a dynamical system 161
5.4.2 Gradient systems 162
5.4.3 Autonomous non-gradient systems 163
5.4.4 Sensitive states of autonomous systems 164
5.4.5 The centre manifold theorem 167

5.4.6 Relation between the Tikhonov theorem and the centre manifold theorem 170
5.4.7 Example of application of the centre manifold theorem 172
5.5 Classification of catastrophes in dynamical systems 175
5.5.1 Introduction 175
5.5.2 Catastrophes of codimension one 177
5.5.2.1 Saddle node bifurcation 178
5.5.2.2 Transcritical bifurcation 180
5.5.2.3 Pitchfork bifurcation 181
5.5.2.4 Hopf bifurcation 183
5.5.2.5 Structural stability of catastrophes of codimension one 185
5.5.3 Catastrophes of codimension two 186
5.5.3.1 Introduction 186
5.5.3.2 Cusp catastrophe 186
5.5.3.3 Degenerate Hopf bifurcation 187
5.5.3.4 Takens–Bogdanov bifurcation 187
5.5.3.5 Takens–Bogdanov bifurcation with the additional stationary state $\bar{x} = 0$ 189
5.5.3.6 Takens–Bogdanov bifurcation with symmetry under rotation through the angle π 189
5.5.3.7 Pitchfork–Hopf bifurcation 189
5.5.3.8 Pitchfork–Hopf bifurcation with symmetry under reflection $x_3 \rightarrow -x_3$ 189
5.5.3.9 Double Hopf bifurcation without resonance 189
5.5.4 Catastrophes of codimension three 190
5.6 Elementary analysis of dynamical catastrophes 190
5.7 Methods of examination of equations of reactions with diffusion 195
5.7.1 Introduction 195
5.7.2 Stability of spatially homogeneous stationary solutions to a system of equations with diffusion 196
5.7.3 Classification of catastrophes associated with a loss of stability by a spatially homogeneous stationary state (wave phenomena) 201
5.8 Analogies between elementary and generalized catastrophe theory 202

Appendix to Chapter 5 204
A5.1 Properties of a phase plane 204
A5.2 The Poincaré–Bendixon theorem 206
A5.3 Theory of vector field rotation 206
A5.4 Time evolution on the trajectories of a dynamical system 208
A5.5 The Lyapunov function method 208
A5.6 The isocline method of constructing a phase portrait 211
A5.7 Fractal dimension 213
A5.8 The Routh–Hurwitz criterion 215
References 217

6. **Catastrophes in chemical reactions** 219
6.1 Introduction 219

6.2 The Belousov–Zhabotinskii reaction 220
6.2.1 Introduction 220
6.2.2 Dynamical states of the Belousov–Zhabotinskii reaction 223
6.2.2.1 Concentration oscillations (time periodicity) 223
6.2.2.2 Spatial structures (space periodicity) 225
6.2.2.3 Waves 225
6.2.2.4 Chaotic state 227
6.2.3 Qualitative description of mechanism of the Belousov–Zhabotinskii reaction (the Fields–Körös–Noyes mechanism) 228
6.2.4 Simplified model of mechanism of the BZ reaction – the Oregonator 233
6.3 Kinetic models and their analysis 235
6.3.1 Kinetic equations of reactions without diffusion 235
6.3.1.1 Introduction 235
6.3.1.2 The reactant–product equilibrium 236
6.3.1.3 The reactant–product equilibrium in the presence of a catalyst . 236
6.3.1.4 Irreversible autocatalytic reaction 237
6.3.1.5 Reversible autocatalytic reaction 238
6.3.1.6 Reversible autocatalytic reaction with a following reaction 238
6.3.1.7 The Schloegl reaction 239
6.3.1.8 The Edelstein reaction 240
6.3.1.9 The Lotka model 243
6.3.1.10 The Sel'kov model 246
6.3.1.11 The Brusselator 249
6.3.1.12 The Oregonator 252
6.3.1.13 The Bykov model 257
6.3.2 Models of reactions with diffusion and their analysis 260
6.3.2.1 Introduction 260
6.3.2.2 The Fisher–Kolmogorov model of reactions with diffusion 260
6.3.2.3 The Oregonator with diffusion 264
6.3.2.4 The Brusselator with diffusion 267
6.3.3 Chemical chaos 271
6.4 Catastrophes associated with the changes in distribution of molecular electron density 274
6.4.1 Introduction 274
6.4.2 Description of the method of analysis of electron density distributions 274
6.5 Conclusion 277
