Preface	xiii

1. Multiscale Graph-Theoretic Modeling of Biomolecular Structures	1
<i>John Jungck, Debra Knisley, Greta Pangborn, Manda Riehl and Emilie Wiesner</i>	
1.1 Introduction	1
1.1.1 The Molecules of Life	1
1.2 Graph Theory Fundamentals	2
1.3 Modeling RNA Structure	3
1.3.1 RNA Secondary Structure Features	6
1.3.2 Tree and Dual Graph Models of RNA Secondary Structure	9
1.3.3 Homework Problems and Projects	13
1.4 RNA Structure and Matchings	17
1.4.1 L&P Matchings	19
1.4.2 The C&C Family	21
1.4.3 Homework Problems and Projects	22
1.5 Hierarchical Protein Models	23
1.5.1 Weighted Graph Invariants	29
1.5.2 Homework Problems and Projects	31
References	31
Further Reading	34
2. Tile-Based DNA Nanostructures	35
<i>Joanna Ellis-Monaghan, Nataša Jonoska and Greta Pangborn</i>	
2.1 Introduction	35
2.2 Laboratory Process	36
2.3 Graph Theoretical Formalism and Tools	39
2.3.1 Flexible Tiles	42
2.3.2 Flexible Tiles, Unconstrained Case	43
2.3.3 Flexible Tiles, Constrained Case	45
2.3.4 The Matrix of a Pot	47
2.4 Rigid Tiles	50
2.5 Computation by Self-Assembly	54
2.6 Conclusion	57

2.7	Resource Materials	57
	Acknowledgments	58
	References	58
	Further Reading	60
3.	Graphs Associated With DNA Rearrangements and Their Polynomials	61
	<i>Robert Brijder, Hendrik Jan Hoogeboom, Nataša Jonoska and Masahico Saito</i>	
3.1	Introduction	61
3.2	Gene Assembly in Ciliates	63
3.2.1	Biological Background	63
3.2.2	Motivational Example	64
3.3	Mathematical Preliminaries	66
3.4	Mathematical Models for Gene Rearrangement	70
3.4.1	Graphs Obtained From Double Occurrence Words	70
3.4.2	Double Occurrence Words Corresponding to Graphs	72
3.5	Graph Polynomials	74
3.5.1	Transition Polynomial	74
3.5.2	Assembly Polynomial	77
3.5.3	Reduction Rules for the Assembly Polynomial	79
3.5.4	Rearrangement Polynomial	82
3.6	Generalizations	84
	Acknowledgments	84
	References	85
4.	The Regulation of Gene Expression by Operons and the Local Modeling Framework	89
	<i>Matthew Macauley, Andy Jenkins and Robin Davies</i>	
4.1	Basic Biology Introduction	89
4.1.1	The Central Dogma and Gene Regulation	90
4.1.2	Types of Operons	91
4.1.3	Two Well-Known Operons in <i>E. coli</i>	94
4.2	Continuous and Discrete Models of Biological Networks	98
4.2.1	Differential Equation Models	98
4.2.2	Bistability in Biological Systems	102
4.2.3	Discrete Models of Biological Networks	104
4.3	Local Models	106
4.3.1	Polynomial Rings and Ideals for the Nonexpert	106
4.3.2	Finite Fields	107
4.3.3	Functions Over Finite Fields	109
4.3.4	Boolean Networks and Local Models	112
4.3.5	Asynchronous Boolean Networks and Local Models	115
4.3.6	Phase Space Structure	117

4.4	Local Models of Operons	118
4.4.1	A Boolean Model of the <i>lac</i> Operon	118
4.4.2	A Boolean Model of the <i>ara</i> Operon	122
4.5	Analyzing Local Models With Computational Algebra	124
4.5.1	Computing the Fixed Points	125
4.5.2	Longer Limit Cycles	130
4.6	Software for Local Models	131
4.6.1	GINsim	132
4.6.2	TURING: Algorithms for Computation With FDSs	135
4.7	Concluding Remarks	140
	References	143
5.	Modeling the Stochastic Nature of Gene Regulation With Boolean Networks	147
	<i>David Murrugarra and Boris Aguilar</i>	
5.1	Introduction	147
5.2	Stochastic Discrete Dynamical Systems	149
5.3	Long-Term Dynamics	157
5.4	PageRank Algorithm	158
5.5	Parameter Estimation Techniques	161
5.6	Optimal Control for SDDS	165
5.6.1	Control Actions	166
5.6.2	Markov Decision Processes for SDDS	166
5.7	Discussion and Conclusions	170
	References	171
6.	Inferring Interactions in Molecular Networks via Primary Decompositions of Monomial Ideals	175
	<i>Matthew Macauley and Brandilyn Stigler</i>	
6.1	Introduction	175
6.1.1	The Local Modeling Framework	175
6.1.2	A Motivating Example of Reverse Engineering	178
6.2	Stanley-Reisner Theory	180
6.2.1	Monomial Ideals	180
6.2.2	Square-Free Monomial Ideals	182
6.2.3	Primary Decompositions	188
6.3	Finding Min-Sets of Local Models	191
6.3.1	Wiring Diagrams	191
6.3.2	Feasible and Disposable Sets of Variables	192
6.3.3	Min-Sets Over Non-Boolean Fields	198
6.4	Finding Signed Min-Sets of Local Models	199
6.4.1	The Pseudo-Monomial Ideal of Signed Nondisposable Sets	199
6.4.2	A Non-Boolean Example	202

6.5	Applications to a Real Gene Network	203
6.6	Concluding Remarks	207
	References	210
7.	Analysis of Combinatorial Neural Codes: An Algebraic Approach	213
	<i>Carina Curto, Alan Veliz-Cuba and Nora Youngs</i>	
7.1	Introduction	213
7.1.1	Biological Motivation: Neurons With Receptive Fields	213
7.1.2	Receptive Field Relationships	216
7.1.3	The Simplicial Complex of a Code	218
7.2	The Neural Ideal	220
7.2.1	Definition of the Neural Ideal	221
7.2.2	The Neural Ideal and Receptive Field Relationships	223
7.3	The Canonical Form	226
7.3.1	Computing the Canonical Form	227
7.3.2	Alternative Computation Method: The Primary Decomposition	229
7.3.3	Sage Code for Computations	230
7.4	Applications: Using the Neural Ideal	232
7.4.1	Convex Realizability	232
7.4.2	Dimension	237
7.5	Concluding Remarks	238
	Acknowledgments	239
	References	239
	Further Reading	240
8.	Predicting Neural Network Dynamics via Graphical Analysis	241
	<i>Katherine Morrison and Carina Curto</i>	
8.1	Introduction	241
8.1.1	Neuroscience Background and Motivation	241
8.1.2	The CTLN Model	242
8.2	A CTLN as a Patchwork of Linear Systems	246
8.2.1	How Graph Structure Affects Fixed Points	248
8.3	Graphical Analysis of Stable and Unstable Fixed Points	252
8.3.1	Graph Theory Concepts	253
8.3.2	Stable Fixed Points	255
8.3.3	Unstable Fixed Points	257
8.4	Predicting Dynamic Attractors via Graph Structure	265
8.4.1	Sequence Prediction Algorithm	267
8.4.2	Symmetry of Graphs Acting on the Space of Attractors	271
	Acknowledgments	274
A.1	Review of Linear Systems of ODEs	275
	References	276

9. Multistationarity in Biochemical Networks: Results, Analysis, and Examples	279
<i>Carsten Conradi and Casian Pantea</i>	
9.1 Introduction	279
9.2 Reaction Network Terminology and Background	281
9.2.1 Chemical Reaction Networks and Their Dynamics	281
9.2.2 Some Useful Notation	283
9.2.3 The Jacobian Matrix	284
9.2.4 Stoichiometry Classes	285
9.2.5 Equilibria	286
9.2.6 Nondegenerate Equilibria	288
9.2.7 The Reduced Jacobian	289
9.2.8 General Setup and Preliminaries	289
9.3 Necessary Conditions for Multistationarity I: Injective CRNs	295
9.4 Necessary Conditions for Multistationarity II: The DSR Graph	300
9.5 Sufficient Conditions for Multistationarity: Inheritance of Multiple Equilibria	304
9.6 Sufficient Conditions for Multistationarity II: The Determinant Optimization Method	308
9.7 Results Based on Deficiency Theory	309
9.7.1 The Deficiency Zero and Deficiency One Theorems	310
9.7.2 The Deficiency One Algorithm and the Advanced Deficiency Algorithm	312
Acknowledgments	313
References	313
10. The Minimum Evolution Problem in Phylogenetics: Polytopes, Linear Programming, and Interpretation	319
<i>Stefan Forcey, Gabriela Hamerlinck, Logan Keefe and William Sands</i>	
10.1 Introduction	319
10.1.1 Phylogenetic Reconstructions and Interpretation	319
10.1.2 Balanced Minimum Evolution	321
10.1.3 Definitions and Notation	324
10.2 Polytopes and Relaxations	327
10.2.1 What Is a Polytope?	327
10.2.2 The BME Polytope	328
10.2.3 The Splitohedron	335
10.3 Optimizing With Linear Programming	336
10.3.1 Discrete Integer Linear Programming: The Branch and Bound Algorithm	337
10.3.2 Recursive Structure: Branch Selection Strategy and Fixing Values	340
10.3.3 Pseudocode for the Algorithm: POLYSPLIT	342

10.4	Neighbor Joining and Edge Walking	346
10.4.1	NNI and SPR Moves, and FASTME 2.0	346
10.5	Summary	347
	References	347
11.	Data Clustering and Self-Organizing Maps in Biology	351
	<i>Olcay Akman, Timothy Comar, Daniel Hrozencik and Josselyn Gonzales</i>	
11.1	Clustering: An Introduction	351
11.2	Clustering: A Basic Procedure	354
11.2.1	Data Representation	354
11.2.2	Clustering Algorithm Selection	355
11.2.3	Cluster Validation	356
11.2.4	Interpretation of Results	357
11.3	Types of Clustering	358
11.3.1	Hard Clustering	358
11.3.2	Exercises	362
11.4	Fuzzy Clustering	363
11.5	Self-Organizing Maps	365
11.6	SOM Applications to Biological Data	368
11.6.1	Example 1: Water Composition Data	368
11.6.2	Example 2: Grasshopper Size Data	370
11.6.3	Group Project: Iris Data Set	373
	References	373
12.	Toward Revealing Protein Function: Identifying Biologically Relevant Clusters With Graph Spectral Methods	375
	<i>Robin Davies, Urmi Ghosh-Dastidar, Jeff Knisley and Widodo Samyono</i>	
12.1	Introduction to Proteins	375
12.1.1	Protein Structures	375
12.1.2	Experimental Determination of Protein Structure	378
12.1.3	Isofunctional Families	379
12.1.4	Sequence Motifs and Logos	380
12.2	Clustering of Data	382
12.2.1	An Overview	382
12.2.2	Clustering Methods	384
12.2.3	Network Spectral Methods	390
12.2.4	Spectral Clustering	391
12.2.5	Spectral Clustering With Outliers	396
12.3	Clustering to Identify Isofunctional Families	398
12.3.1	Similarity Scores Based on Tertiary Structure	398
	Appendix	406
	References	408
