

CHEMICAL KINETICS

EDITED BY

C.H. BAMFORD

M.A., Ph.D., Sc.D. (Cantab.), F.R.I.C., F.R.S.
*Formerly Campbell-Brown Professor of Industrial Chemistry,
University of Liverpool*

The late C.F.H. TIPPER

Ph.D. (Bristol), D.Sc. (Edinburgh)
*Senior Lecturer in Physical Chemistry,
University of Liverpool*

AND

R.G. COMPTON

M.A., D.Phil. (Oxon.)
*Lecturer in Physical Chemistry,
University of Liverpool*

VOLUME 25

DIFFUSION-LIMITED REACTIONS

by

STEPHEN A. RICE

B.Sc. (London), D.Phil. (Oxon.), A.R.C.S., M.R.S.C.

ELSEVIER

AMSTERDAM—OXFORD—NEW YORK—TOKYO

1985

Contents

Preface	ix
<i>Chapter 1</i>	
Introduction	1
<i>Chapter 2</i>	
Diffusion-controlled reactions in solution	3
1. Introduction	3
2. Evidence that some reactions are diffusion-controlled	4
2.1 Fluorescence and phosphorescence quenching	4
2.2 Fluorescence and phosphorescence quenching due to energy transfer	5
2.3 Quenching of luminescence from metal complexes by electron transfer	5
2.4 Reactions of the solvated electron	5
2.5 Proton transfer reactions	6
2.6 Radical recombination reactions	6
2.7 Other systems	7
3. The Smoluchowski theory	7
3.1 A phenomenological approach	7
3.2 The mutual distribution of reactants	9
3.3 The initial distribution	10
3.4 Boundary conditions	11
3.5 The diffusion equation	12
3.6 Solution for the density distribution	14
3.7 The Smoluchowski rate coefficient	17
3.8 Other initial distributions and the Green's function	19
4. The incorporation of chemical reaction rates into the diffusion model	21
4.1 The relative magnitude of chemical and diffusion reaction rates	21
4.2 The partially reflecting boundary condition	22
4.3 Solution for the density distribution	23
4.4 The rate coefficient for a partially reflecting boundary condition	25
5. A comparison of experimental results with the Smoluchowski theory	27
5.1 Which experimental results are of prime concern?	27
5.2 Radical reactions	27
5.3 Reactions of the solvated electron	29
5.4 Fluorescence quenching	31
5.5 Stern—Volmer quenching	34
5.6 Reaction of carbon monoxide with microperoxidase	38
6. Complications to the simple diffusion model	39
6.1 Introduction	39
6.2 Direct intermolecular forces	40

6.3	Long-range transfer	40
6.4	Angular and rotational effects	41
6.5	Spin statistical factors	41
6.6	Solvent caging	42
6.7	Competitive effects	43
6.8	The inapplicability of the diffusion equation	44
6.9	The diffusion coefficient and the Stokes—Einstein relationship	45

Chapter 3

Reactions between ions in solution	47
1. Theoretical considerations for ionic reactions in solutions	47
1.1 Derivation of the Debye—Smoluchowski equation	47
1.2 Boundary and initial conditions	48
1.3 The steady-state density and rate coefficient	49
1.4 The time-dependent rate coefficient	51
1.5 The relaxation of the relative permittivity	53
1.6 Dilute electrolyte solutions	57
1.7 Concentrated electrolyte solutions	59
2. Experimental studies of ionic reactions in solution	61
2.1 Reactions of the hydrated electron with dilute electrolytes	61
2.2 Reactions of the solvated electron in concentrated ionic solutions	63
2.3 Quenching of the fluorescence from metal ligand complexes	66
2.4 Ion pairing effects and ionic reactions in ethanol and water	67
2.5 Conclusions	69

Chapter 4

Long-range transfer effects and diffusion-controlled reactions	71
1. General theoretical considerations	71
1.1 Long-range transfer processes	71
1.2 Long-range transfer and the diffusion equation	72
1.3 Boundary and initial conditions	73
1.4 The rate coefficients	74
1.5 Other theoretical approaches	76
2. The dipole—dipole interaction	77
2.1 The nature of the interaction	77
2.2 Steady-state coefficient	79
2.3 Time-dependent rate coefficient	79
2.4 Dipole—dipole energy transfer in viscous media	82
2.5 Experimental studies	85
2.6 Diffusion and dipole—quadrupole energy transfer	89
3. The exchange effect	90
3.1 The nature of the effect	90
3.2 The steady-state rate coefficient	91
3.3 Time-dependent rate coefficient	93
3.4 Exchange-mediated energy transfer in viscous media	94
3.5 Experimental studies	95
4. Electron tunnelling	98
4.1 The nature of the interaction	98
4.2 The steady-state rate coefficient	100
4.3 The time-dependent rate coefficient	101
4.4 Electron tunnelling in viscous media	101
4.5 Experimental studies	101
5. Conclusions	103

Chapter 5

Rotational diffusion effects	105
1. Introduction	105
1.1 Chemical reaction and rotational diffusion rates	105
1.2 Molecular reactants which are anisotropically reactive	105
2. Theoretical aspects of rotational relaxation	106
2.1 Hydrodynamic theories	106
2.2 Extended diffusion models	107
2.3 Microscopic boundary layer effects	107
3. Experimental studies of rotational relaxation	108
3.1 Light scattering	108
3.2 Fluorescence depolarisation	109
4. Simultaneous rotational and translational diffusion	111
4.1 Theoretical analyses	111
4.2 Are rotational relaxation effects important in chemical reactions?	114
4.3 Reaction between ions and dipoles	114
4.4 Recombination of carbon monoxide and microperoxidase	116

Chapter 6

The escape probability of an isolated pair	119
1. Introduction	119
2. Geminate radical recombination. Theory	119
2.1 Introduction	119
2.2 From the diffusion equation to escape and survival probabilities	121
2.3 The cage effect	125
2.4 Other analyses of geminate radical recombination	132
3. Experimental studies of radical and molecular recombination	135
3.1 Introduction	135
3.2 Steady-state studies of the recombination probability	137
3.3 Iodine atom recombination	140
3.4 Other studies of the time-dependent recombination probability	146
4. The effect of a magnetic field on radical pair recombination	147
4.1 Introduction	147
4.2 Chemically induced magnetic polarisation	148

Chapter 7

Geminate ion-pair recombination	151
1. Introduction	151
2. Theory of recombination of ion-pairs	153
2.1 Recombination and escape probabilities	153
2.1.1 Ultimate recombination probability in the absence of an applied electric field	155
2.1.2 Ultimate recombination probability of an ion-pair in an applied electric field	157
2.1.3 Survival probability of an ion-pair in an applied electric field	158
2.2 Complications to the analysis of the recombination probability	159
2.3 The survival probability and the density distribution	165
2.4 Scavenging of one or other moiety of an ion-pair	170
2.5 Scavenging (at high concentrations) of one or other moiety of an ion-pair	174
3. Experimental studies of geminate ion-pair recombination	176

3.1	Introduction	176
3.2	Recombination probability from ion yields	177
3.3	Scavenging studies on ion-pairs	184
3.4	Time-dependent studies of geminate recombination	188
3.5	The effect of a magnetic field on geminate ion-pair recombination	194
4.	Spurs produced by high-energy radiation	196
4.1	Introduction	196
4.2	Evidence for the formation of ion clusters (spurs)	197
4.3	The structure of tracks	203
4.4	Diffusion kinetic analysis of spur-decay processes	206

Chapter 8

A critique of the diffusion equation and molecular pair treatments	213
1. Introduction	213
2. Diffusion equation analysis	214
2.1 The validity of the diffusion equation	214
2.2 The initial condition	221
2.3 The outer boundary condition	224
2.4 The inner boundary condition	227
2.5 Hydrodynamic effects	232
2.6 The potential of mean force	235
2.7 Intermolecular forces between reactants	237
3. Molecular pair analysis	242
3.1 Behaviour of molecular pairs in homogeneous reaction	242
3.2 Diffusion or random walk approximations for $h(t)$	244
3.3 Other analyses of reaction rates, $h(t)$	246
3.4 First passage time analyses	249
4. Conclusions, for future work	250
4.1 On experimental studies	251
4.2 On theoretical studies	252

Chapter 9

Refinements to the diffusion equation analysis to include many-body effects	255
1. Introduction	255
2. The diffusion of an isolated pair	257
2.1 The diffusion equation	257
2.2 The solution of the diffusion equations	259
3. Hydrodynamic repulsion and the diffusion equation	261
3.1 Hydrodynamic repulsion	261
3.2 Incorporation of the hydrodynamic repulsion into the diffusion equation	262
3.3 Reduction to an isolated pair equation	265
3.4 The rate coefficient including hydrodynamic repulsion	267
3.5 Other analyses of hydrodynamic repulsion	269
4. The Wilemski and Fixman theory of fluorescence quenching	271
4.1 The model	271
4.2 The macroscopic rate equation	273
4.3 Comments	276
5. Competitive effects in reactions	278
5.1 Early work	278
5.2 The local density	278
5.3 The "strength of reaction"	282

5.4	The rate coefficient	285
5.5	Comments	286
6.	The density and survival probability of radicals and ions in clusters	289
6.1	A single diffusing species near two spherical sinks	289
6.2	A single anion diffusing near several stationary cations	291
6.3	The derivation of the stochastic equation for a cluster	292
6.4	Escape of particles from a local cluster	295

Chapter 10

The variational principle	299
1. Introduction	299
2. The Lagrangian density	300
2.1 Definition of the Lagrangian density	300
2.2 The Lagrangian density for diffusion	301
2.3 Incorporation of initial and boundary conditions	302
2.4 An example of the use of the variational principle	304
3. Rate coefficients from the variational principle	305
3.1 An upper bound on the rate coefficient	305
3.2 A lower bound on the rate coefficient	308
4. Diffusion on a cubic lattice of sinks	309
5. Further estimates of the rate coefficient	311
5.1 Development of the rate coefficient	311
5.2 Expansion of the Green's function in eigen-functions	313
5.3 A variation principle	314
5.4 The lower bound on the rate coefficient	315
5.5 Two examples of this variational approach	316
6. Conclusions	318

Chapter 11

Phenomenological Brownian motion	319
1. Introduction	319
2. The velocity autocorrelation function	321
2.1 Theoretical considerations	321
2.2 Observation and simulations	322
3. From the Langevin equation to the diffusion equation	326
3.1 The Langevin description of Brownian motion	326
3.2 The Fokker-Planck equation	328
3.3 The telegrapher's equation	329
3.4 The Burnett equation	331
4. The generalised Langevin equation and chemical reactions	332
4.1 The generalised Langevin equation	332
4.2 The generalised Langevin equation and reactions in solution	334
5. Computer simulations	336

Chapter 12

The kinetic theory applied to chemical reactions in solutions	339
1. Introduction	339
2. The kinetic theory of fluids	340
2.1 The Liouville equation	340
2.2 The pseudo-Liouville equation for hard spheres	341

3. The rate of a chemical reaction from the kinetic theory of fluids	344
3.1 Inclusion of a chemical reaction into kinetic theory	344
3.2 The cluster expansion and super-position approximation	347
3.3 An approximate equation for the singlet density	348
3.4 The macroscopic rate kernel	350
3.5 Approximate forms of the macroscopic rate coefficient	351
4. Extensions to the kinetic theory	353
4.1 Reversible reactions and the competitive effect	353
4.2 Recombination probability of radicals	356

Appendix A

Second-order partial differential equations and Green's functions	361
1. Dirac delta functions	361
2. Inhomogeneous second-order (partial) differential equations	361
3. The Green's theorem and function	363
4. The Green's function for the Debye—Smoluchowski equation	364
5. Green's theorem and the variation of parameters	368
6. Causality	370
7. Reciprocity	370

Appendix B

The relationship between the lifetime distribution and the diffusion equation . . .	373
1. The lifetime distribution	373
2. The average scavenging probability	373
3. Averaging over the initial distribution	374
4. Towards the diffusion equation analysis	374

Appendix C

The molecular pair approach	377
--	------------

Appendix D

The general equation of reaction kinetics	381
Acknowledgements	386
References	387
Index	401
