

## Contents

### Preface *xi*

- 1 Introduction 1**
  - 1.1 Different Is Usually Controversial 1
  - 1.2 The Plan: Addressing Dirac's Challenge 2
  - Reference 4
  
- 2 The Hydrogen Atom 5**
  - 2.1 The Bohr Model 5
  - 2.2 The Schrödinger Equation 8
  - 2.3 The Electronic Structure of Atoms and the Periodic Table 15
  - References 18
  
- 3 Many-electron Atoms 19**
  - 3.1 The Variational Principle 19
  - 3.1.1 Estimating the Energy of a Helium Atom 21
  - 3.2 The Hartree Approximation 22
  - 3.3 The Hartree–Fock Approximation 25
  - References 27
  
- 4 The Free Electron Gas 29**
  - 4.1 Free Electrons 29
  - 4.2 Hartree–Fock Exchange in a Free Electron Gas 35
  - References 36
  
- 5 Density Functional Theory 37**
  - 5.1 Thomas–Fermi Theory 37
  - 5.2 The Kohn–Sham Equation 40
  - References 43
  
- 6 Pseudopotential Theory 45**
  - 6.1 The Pseudopotential Approximation 45
  - 6.1.1 Phillips–Kleinman Cancellation Theorem 47

- 6.2 Pseudopotentials Within Density Functional Theory 50  
References 57
  
- 7 Methods for Atoms 59**
  - 7.1 The Variational Approach 59
    - 7.1.1 Estimating the Energy of the Helium Atom. 59
  - 7.2 Direct Integration 63
    - 7.2.1 Many-electron Atoms Using Density Functional Theory 67
  - References 69
  
- 8 Methods for Molecules, Clusters, and Nanocrystals 71**
  - 8.1 The H<sub>2</sub> Molecule: Heitler–London Theory 71
  - 8.2 General Basis 76
    - 8.2.1 Plane Wave Basis 79
    - 8.2.2 Plane Waves Applied to Localized Systems 87
  - 8.3 Solving the Eigenvalue Problem 89
    - 8.3.1 An Example Using the Power Method 92
  - References 95
  
- 9 Engineering Quantum Mechanics 97**
  - 9.1 Computational Considerations 97
  - 9.2 Finite Difference Methods 99
    - 9.2.1 Special Diagonalization Methods: Subspace Filtering 101
  - References 104
  
- 10 Atoms 107**
  - 10.1 Energy levels 107
  - 10.2 Ionization Energies 108
  - 10.3 Hund’s Rules 110
  - 10.4 Excited State Energies and Optical Absorption 113
  - 10.5 Polarizability 122
  - References 124
  
- 11 Molecules 125**
  - 11.1 Interacting Atoms 125
  - 11.2 Molecular Orbitals: Simplified 125
  - 11.3 Molecular Orbitals: Not Simplified 130
  - 11.4 Total Energy of a Molecule from the Kohn–Sham Equations 132
  - 11.5 Optical Excitations 137
    - 11.5.1 Time-dependent Density Functional Theory 138
  - 11.6 Polarizability 140
  - 11.7 The Vibrational Stark Effect in Molecules 140
  - References 150
  
- 12 Atomic Clusters 153**
  - 12.1 Defining a Cluster 153

12.2	The Structure of a Cluster	154
12.2.1	Using Simulated Annealing for Structural Properties	155
12.2.2	Genetic Algorithms	159
12.2.3	Other Methods for Determining Structural Properties	162
12.3	Electronic Properties of a Cluster	164
12.3.1	The Electronic Polarizability of Clusters	164
12.3.2	The Optical Properties of Clusters	166
12.4	The Role of Temperature on Excited-state Properties	167
12.4.1	Magnetic Clusters of Iron	169
	References	174
<b>13</b>	<b>Nanocrystals</b>	177
13.1	Semiconductor Nanocrystals: Silicon	179
13.1.1	Intrinsic Properties	179
13.1.1.1	Electronic Properties	179
13.1.1.2	Effective Mass Theory	184
13.1.1.3	Vibrational Properties	187
13.1.1.4	Example of Vibrational Modes for Si Nanocrystals	188
13.1.2	Extrinsic Properties of Silicon Nanocrystals	190
13.1.2.1	Example of Phosphorus-Doped Silicon Nanocrystals	191
	References	197
<b>A</b>	<b>Units</b>	199
<b>B</b>	<b>A Working Electronic Structure Code</b>	203
	References	206
	<b>Index</b>	207
