

CHEMICAL KINETICS

EDITED BY

C. H. BAMFORD

M.A., Ph.D., Sc.D. (Cantab.), F.R.I.C., F.R.S.
*Campbell-Brown Professor of Industrial Chemistry,
University of Liverpool*

AND

C. F. H. TIPPER

Ph.D. (Bristol), D.Sc. (Edinburgh)
*Senior Lecturer in Physical Chemistry,
University of Liverpool*

VOLUME 15

NON-RADICAL POLYMERISATION

ELSEVIER SCIENTIFIC PUBLISHING COMPANY

AMSTERDAM – OXFORD – NEW YORK

1976

Contents

Preface	vii
-------------------	-----

Chapter 1 (S. Bywater)

Anionic polymerization of olefins	1
1. Introduction	1
2. Some general experimental considerations	4
3. Polymerization of styrene and dienes in hydrocarbon solvents	9
3.1 The initiation step	9
3.2 The propagation step	16
3.3 Effect of polar materials on chain propagation	21
4. Polymerization of styrene and dienes in polar solvents	23
4.1 The initiation step	23
4.2 The propagation step	28
5. Polymerization of polar monomers	40
6. Stereospecificity in the propagation step	48
7. Copolymerization	53
References	60

Chapter 2 (A. Ledwith and D. C. Sherrington)

Kinetics of homogeneous cationic polymerization	67
1. Introduction	67
2. Complex nature of cationic systems	68
3. Methods of initiation	69
4. Kinetic schemes	71
5. Free ion-pair equilibria	75
6. Polymerization of vinyl monomers	78
6.1 Molecular iodine as an initiator	78
6.2 Polymerization by protonic acids — pseudocationic polymerization	81
6.3 Stable carbonium ion salts as initiators	86
6.4 Polymerization by γ -ray irradiation	89
6.5 A comparison of rate propagation data	92
6.5.1 Relevance of numerical values	92
6.5.2 Solvent effects	96
6.5.3 Energetics of propagation reactions	98
7. Polymerization of cyclic monomers	102
7.1 Polymerization of tetrahydrofuran, THF	103
7.2 Polymerization of thietans	110
7.3 Polymerization of oxetans, cyclic formals and formaldehyde	117
7.4 Summary of propagation data and comparison with vinyl monomers	123
References	127

Kinetics of Polymerization initiated by Ziegler-Natta and related catalysts	133
1. Introduction	133
2. Catalyst structure	135
2.1 Natta catalysts	135
2.2 Ziegler catalysts	139
2.3 Metal oxide supported catalysts	140
2.4 Soluble catalysts	143
2.5 Other catalysts	145
3. Initiation	146
4. Propagation and stereo regulation	147
5. Transfer	148
5.1 Transfer with monomer	148
5.2 Transfer with metal-alkyl	149
5.3 Transfer with transition metal compound	149
5.4 Transfer with hydrogen	150
6. Termination	150
7. Kinetics	151
7.1 General features	151
7.1.1 Polymerization rate	152
7.1.2 Polymer molecular weight	159
7.1.3 Catalyst association-dissociation	161
7.1.4 Retardation and inhibition of polymerization	162
7.1.5 Retardation resulting from encapsulation of catalyst by insoluble polymer	167
7.2 Polymerization data	169
7.2.1 Initiation stages	169
7.2.2 Active centre concentrations	172
7.2.3 Propagation rates	181
7.2.4 Transfer	181
7.2.5 Lifetimes of growing chains	187
7.2.6 Termination	189
7.2.7 Molecular weight distribution	189
8. Individual monomers	191
8.1 Ethylene	192
8.2 Propene	204
8.3 Styrene	208
8.4 Butadiene	211
8.4.1 Cobalt catalysts	212
8.4.2 Nickel catalysts	216
8.4.3 Titanium catalysts	218
8.4.4 Chromium catalysts	221
8.4.5 Rhodium catalysts	222
8.5 Other monomers	223
8.5.1 Butene-1	223
8.5.2 Hexene-1	224
8.5.3 4-Methylpentene-1	224
8.5.4 Other olefins	225
8.5.5 Isoprene	226
8.5.6 1,3-Pentadiene	227

8.5.7	Propadiene	228
8.5.8	Methyl methacrylate	229
8.5.9	Vinyl chloride	231
8.5.10	Vinyl fluoride	232
9.	Copolymerization	232
9.1	Ethylene/propene	233
9.2	Ethylene/butene-1	239
9.3	Propene/butene-1	240
9.4	Styrene/ α -d-styrene	240
9.5	Styrene/ β , β -d ₂ -styrene	241
9.6	Styrene/propene	241
9.7	Styrene-nuclear substituted styrenes	241
9.8	Conjugated dienes	242
9.9	Alternating copolymers	242
10.	Equilibrium coordination polymerization	246
	Note added in proof	247
	References	249

Chapter 4 (P. Dreyfuss and M. P. Dreyfuss)

	Polymerization of cyclic ethers and sulphides	259
1.	Introduction	259
2.	Epoxides and episulphides	259
2.1	Epoxides	260
2.1.1	Anionic polymerization	260
2.1.2	Cationic polymerization	263
2.1.3	Coordinate polymerization	264
2.2	Thiiranes	267
2.2.1	Anionic polymerization	267
2.2.2	Cationic polymerization	269
2.2.3	Coordinate polymerization	271
3.	Oxetanes and thietanes	272
3.1	Oxetanes	272
3.1.1	Oxetane	272
3.1.2	3-Methyl and 3,3-dimethyloxacyclobutanes	277
3.1.3	3,3-bis(Chloromethyl)oxetane(BCMO)	280
3.1.4	Other substituted oxetanes	282
3.2	Thietanes	283
3.2.1	Cationic polymerization	283
3.2.2	Anionic polymerization	286
3.3	An oxetane-thietane	286
4.	Tetrahydrofurans and tetrahydrothiophenes	287
4.1	Tetrahydrofuran	287
4.1.1	Characteristic features of THF polymerizations	287
4.1.2	Kinetics with specific initiators	291
4.2	Substituted tetrahydrofurans	299
4.3	Tetrahydrothiophenes	301
5.	Cyclic ethers and cyclic sulphides with more than five members in the ring	301
6.	Cyclic formals, thials and oxathiolanes	302
6.1	1,3-Dioxolane	303
6.1.1	Triethyloxonium tetrafluoroborate initiation	303

6.1.2	Triethyloxonium hexafluoroantimonate initiation	306
6.1.3	Triethyloxonium hexachloroantimonate initiation	306
6.1.4	Boron trifluoride etherate initiation	307
6.1.5	Perchloric acid initiation	308
6.1.6	Triphenylmethyl hexachloroantimonate initiation	311
6.1.7	Summary	313
6.2	1,3-Dioxepane	313
6.3	Trioxane and trithietane	313
7.	Copolymers	315
7.1	Influence of basicity and ring strain	316
7.2	Individual rate studies	317
7.2.1	Copolymerization of trioxane with 1,3-dioxolane	317
7.2.2	Copolymerization of BCMO with THF below T_c for THF	319
7.2.3	Copolymerization of substituted oxetanes with THF above T_c for THF	320
7.3	Concluding comments	323
8.	Comparisons	323
8.1	Effect of ring size	324
8.2	Basicity	325
	Note added in proof	326
	References	326

Chapter 5 (O. Vogl)

	Kinetics of aldehyde polymerization	331
1.	Introduction	331
2.	Formaldehyde	335
2.1	Anionic polymerization	335
2.2	Cationic polymerization	342
2.3	Radiation induced polymerization	354
2.4	Polymerization of gaseous formaldehyde	356
2.5	Polymerization of formaldehyde in protic media	363
3.	Higher aliphatic aldehydes	368
4.	Haloaldehydes	371
	References	376

Chapter 6 (J. Šebenda)

	Lactams	379
1.	Introduction	379
2.	Equilibria in lactam polymerization	380
2.1	Types of equilibria	381
2.2	Ring-chain equilibria	383
2.3	Molecular weights	386
3.	Polymerizability of lactams	387
3.1	Thermodynamics of lactam polymerization	388
3.1.1	Heat of polymerization	389
3.1.2	Entropy of polymerization	391
3.2	Amide group conformation	392
3.3	Substitution	394

3.4 Heteroatoms	399
3.5 Effect of pressure	400
4. Anionic polymerization	401
4.1 Mechanism of initiation and propagation	401
4.2 Catalysts	405
4.3 Side reactions	407
4.4 Structure of polymer molecules	415
4.5 Molecular weight and distribution	419
4.6 Kinetics of polymerization	423
4.6.1 Dissociation of lactamates	423
4.6.2 Initiation	424
4.6.3 Propagation and depolymerization	426
4.6.4 Anionic copolymerization	434
4.6.5 Adiabatic polymerization	435
5. Cationic polymerization	436
5.1 Initiation and propagation	436
5.2 Deactivation of catalytic species	444
5.3 End groups and molecular weight	447
6. Hydrolytic polymerization	448
6.1 Reaction mechanism	448
6.2 Kinetics	450
6.3 Equilibria	455
7. <i>N</i> -substituted lactams	458
8. Polymerization with isomerization	461
References	465

Chapter 7 (J. H. Saunders and F. Dobinson)

The kinetics of polycondensation reactions	473
1. Introduction	473
2. Statistical treatment of polycondensation reactions	475
3. Physical classification of reaction systems	480
4. Chemical classification of reaction mechanisms	483
4.1 Carbonyl addition reactions	484
4.2 Displacement reactions	491
4.3 Miscellaneous reactions	494
5. Polyesterification	495
5.1 Synthetic routes	495
5.2 Direct esterification	498
5.2.1 Self-catalysis	503
5.2.2 Catalysed esterification	507
5.3 Transesterification	508
5.3.1 Ester-interchange between esters and glycols	512
5.3.2 Polycondensation by transesterification	513
5.4 Acidolysis	518
5.5 Esterolysis	518
5.6 Polyesters from anhydrides	518
5.7 Polyesters from acid chlorides	519
5.8 Miscellaneous reactions	521

6. Polyamidation and related polycondensations	521
6.1 Synthetic routes	522
6.2 Direct amidation	523
6.3 Polyamides from esters	531
6.4 Polyamides by acidolysis	532
6.5 Polyamides and polyimides from anhydrides	532
6.6 Polyamides from acid chlorides	533
6.6.1 Interfacial polyamidation	534
6.6.2 Solution polyamidation	536
6.7 Miscellaneous reactions	538
7. Polyurethane formation	539
7.1 From isocyanates and hydroxyl compounds	540
7.1.1 Reactions of monoisocyanates with alcohols, as model compounds	544
7.1.2 The reactions of diisocyanates with alcohols	546
7.1.3 Catalysis of the isocyanate/hydroxyl reaction	549
7.1.4 Polyurethane formation from diisocyanates	554
7.2 Polyurethane formation from bis-chloroformates	560
8. Polyurea and polyurea-urethane formation	561
8.1 The reaction of isocyanates with amines	562
8.2 Reactions of isocyanates with water	564
8.3 Polyurea and polyurea-urethane formation	567
9. Miscellaneous reactions	570
References	575

Chapter 8 (C. H. Bamford and H. Block)

The Polymerization of <i>N</i>-carboxy-α-amino acid anhydrides	583
Introduction	583
General principles	584
1. Addition reactions of amines	586
2. Polymerization involving ionization of the NCA	591
3. Experimental evidence relating to the polymerization of NCAs	594
4. Polymerization of NCAs unsubstituted at the 3-position initiated by pri- mary and secondary amines	599
5. Polymerization of NCAs carrying a substituent at the 3-position	602
6. Special aspects of initiation	607
7. Effects of substituent groups	610
8. Stereoisomeric effects	613
9. The chain effect	625
10. Copolymerization	630
11. Further kinetic consideration	632
References	634
Index	639
