

CHEMICAL KINETICS

EDITED BY

C. H. BAMFORD

M.A., Ph.D., Sc.D. (Cantab.), F.R.I.C., F.R.S.
*Campbell-Brown Professor of Industrial Chemistry,
University of Liverpool*

AND

C. F. H. TIPPER

Ph.D. (Bristol), D.Sc. (Edinburgh)
*Senior Lecturer in Physical Chemistry,
University of Liverpool*

VOLUME 18
SELECTED ELEMENTARY REACTIONS

ELSEVIER SCIENTIFIC PUBLISHING COMPANY
AMSTERDAM – OXFORD – NEW YORK

1976

Contents

Preface	vii
<i>Chapter 1 (R. D. Kern)</i>	
Dissociation of diatomic molecules	1
1. Introduction	1
2. The shock tube technique	4
2.1 General	4
2.1.1 Instrumentation	4
2.1.2 Impurities	7
2.2 Analytical methods	7
2.2.1 Laser-beam deflection	7
2.2.2 Atomic resonance absorption	9
2.2.3 Other spectroscopic techniques	10
2.2.4 Fast mass spectrometry	10
2.3 Computer analysis of reaction profiles	11
2.4 Experimental errors	11
3. Techniques for measuring recombination rates	12
3.1 Kinetic flash photolysis	12
3.2 Flames	13
3.3 Fast flow systems	15
4. Homonuclear decompositions and recombinations	16
4.1 Hydrogen	16
4.2 Oxygen	20
4.3 Nitrogen	22
4.4 Fluorine	23
4.5 Chlorine	25
4.6 Bromine	25
4.7 Iodine	27
5. Dissociations of heteronuclear molecules	28
5.1 Hydrogen fluoride	28
5.2 Hydrogen chloride	29
5.3 Hydrogen bromide	30
5.4 Chlorine fluoride	31
5.5 Carbon monoxide	31
5.6 Cyanide radical	33
6. Summary	33
References	35
<i>Chapter 2 (J. A. Kerr)</i>	
Metathetical reactions of atoms and radicals	39
1. Introduction	39
2. Background to tabulated data	40
3. Metathetical reactions of atoms	41
3.1 Hydrogen atoms	41
3.2 Fluorine atoms	44

3.3	Chlorine atoms	45
3.4	Bromine atoms	49
3.5	Iodine atoms	51
3.6	Oxygen atoms	54
3.7	Alkali metal atoms	54
4.	Metathetical reactions of inorganic radicals	57
4.1	Hydroxyl radicals	57
4.2	Hydroperoxyl radicals	58
5.	Metathetical reactions of hydrocarbon radicals	58
5.1	Methyl radicals	58
5.2	Ethyl radicals	65
5.3	Propyl radicals	68
5.4	Butyl radicals	69
5.5	Pentyl radicals	69
5.6	Unsaturated and cyclic radicals	70
5.7	Aromatic radicals	71
6.	Metathetical reactions of fluorine-containing alkyl radicals	72
6.1	Mono- and difluoromethyl radicals	72
6.2	Trifluoromethyl radicals	73
6.3	Perfluoroethyl radicals	76
6.4	Perfluoro- <i>n</i> -propyl radicals	78
7.	Metathetical reactions of chlorine-containing alkyl radicals	78
7.1	Trichloromethyl radicals	78
8.	Metathetical reactions of mixed halogen-containing alkyl radicals	79
8.1	Miscellaneous halogenomethyl radicals	79
8.2	Miscellaneous halogenoethyl radicals	80
9.	Metathetical reactions of nitrogen-centred radicals	81
9.1	Amino radicals	81
10.	Metathetical reactions of oxygen-containing radicals	83
10.1	Methoxy radicals	83
10.2	Miscellaneous oxygen-containing radicals	84
11.	Metathetical reactions of silyl radicals	85
12.	Metathetical reactions of miscellaneous radicals containing one carbon atom	87
13.	General features of metathetical reactions	87
13.1	The tunnel effect	87
13.2	Relative reactivities of atoms and radicals	89
13.3	Polanyi relations	89
13.4	Polar effects	93
13.5	Calculation of activation energies	94
13.6	Calculation of <i>A</i> -factors	95
13.7	Equilibrium constants and rate coefficients	96
14.	Metathetical reactions in solution	97
15.	Comparison of gas and solution phase kinetic data	98
	References	99

Chapter 3 (P. I. Abell)

Addition of atoms and radicals to double and triple bonds	111
1. Introduction	111
2. General reviews	111
3. Presentation of data	111
3.1 Addition of hydrogen atoms to double and triple bonds	112
3.1.1 Ethylene	112
3.1.2 Propene	114
3.1.3 Butenes	115
3.1.4 Higher olefins	117
3.1.5 Fluoro-olefins	118
3.1.6 Butadiene	119
3.1.7 Acetylenes	120
3.1.8 Summary	120
3.2 Addition of fluorine atoms to double and triple bonds	121
3.3 Addition of chlorine atoms to double and triple bonds	121
3.4 Addition of bromine atoms to double and triple bonds	124
3.5 Addition of iodine atoms to double and triple bonds	125
3.6 Addition of oxygen atoms to double and triple bonds	126
3.7 Addition of sulphur atoms to double and triple bonds	132
3.8 Addition of selenium atoms to double and triple bonds	135
3.9 Addition of tellurium atoms to double and triple bonds	137
3.10 Addition of nitrogen atoms to double and triple bonds	138
3.11 Addition of carbon atoms to double and triple bonds	141
3.12 Addition of hydroxyl radicals to double and triple bonds	142
3.13 Addition of hydroperoxyl radicals to double bonds	143
3.14 Addition of thiyl and sulphur pentafluoride radicals to double and triple bonds	145
3.15 Addition of difluoroamino radicals to double and triple bonds	146
3.16 Alkyl radical additions to double and triple bonds	147
3.17 Halogenated alkyl radical additions to double and triple bonds	152
3.18 Addition of radicals to aromatic compounds	157
4. Conclusion	158
References	160

Chapter 4 (B. G. Gowenlock, C. A. F. Johnson and J. E. Parker)

Reactions of metals in the gas phase	167
1. Introduction	167
2. Reactions studied by the sodium "flame" techniques	167
2.1 Experimental methods employed	167
2.1.1 Highly dilute flames	167
2.1.2 Diffusion flames	169
2.1.3 Life period method	170
2.1.4 Inverted flames	171
2.1.5 Double reaction vessel	171
2.1.6 Competitive techniques	172
2.2 Calculation of rate coefficient.	172
2.2.1 Highly dilute flames	172

2.2.2 Diffusion flames	172
2.2.3 Life period method	175
2.3 Measurement of Arrhenius parameters for reactions of alkali metals	176
2.4 Theoretical treatments of gradations in reaction rates	178
2.5 Values of rate coefficients for reaction of halogenated organic compounds with sodium	182
2.5.1 The early values	182
2.5.2 Comparisons with the early values	183
2.5.3 Aromatic compounds	186
2.5.4 Cycloalkyl compounds	188
2.5.5 Triple-bonded substituents	188
2.5.6 Other substituents	189
2.5.7 Fluorinated compounds	189
2.6 Rate coefficients and reaction mechanisms for the reactions of halogens and inorganic halides with alkali metal vapours	190
2.6.1 Halogens	190
2.6.2 Hydrogen halides	191
2.6.3 Inorganic halides	191
2.7 Values of rate coefficients for reactions of halogenated organometallic compounds with sodium vapour	194
2.8 Values of rate coefficients for reactions of non-halogenated compounds with alkali-metal vapours	196
2.8.1 Organic non-halogenated compounds	196
2.8.2 Inorganic non-halogenated compounds	197
2.9 The effect of alkali metal atoms on reactions subsequent upon halogen removal from organic halides	199
2.9.1 Studies of stable non-luminescent products	199
2.9.2 Studies of luminescent products	200
2.10 Possible extensions of the techniques	201
3. Molecular beam studies of gas phase metal reactions	202
3.1 Introduction	202
3.2 Experimental methods and results	202
3.2.1 Experimental techniques. General discussion	202
3.2.2 Molecular beam sources	207
3.2.3 Beam orientation and velocity selection	210
3.2.4 Detectors and angular distributions	212
3.3 Theoretical interpretations	214
3.3.1 Alkali-metal plus halide reactions	214
3.3.2 Other reaction systems	219
3.4 Conclusions	222
4. Chemiluminescence	222
5. Co-condensation techniques	226
5.1 Introduction	226
5.2 Experimental methods	227
5.3 Reaction of metal atoms with organic compounds	228
5.4 Reaction of metal vapours with inorganic compounds	230
5.5 Conclusion	231
6. Some other reactions	231
Appendix	233
References	236

Chapter 5 (D. Benson)

Substitution at labile metal ions	247
1. Introduction	247
2. General mechanisms for substitution at a solvated metal ion	247
3. Substitution at a labile metal ion	250
3.1 Coordination number	250
3.2 Solvent exchange	253
3.3 Ion-pair formation	254
4. Kinetics of complex formation	256
4.1 Alkali and alkaline earth metal ions	256
4.2 +2 Transition metal ions	258
4.2.1 Nickel(II)	260
4.2.2 Other +2 transition metal ions	276
4.3 +3 Metal ions	281
4.4 Lanthanide ions	285
References	288

Chapter 6 (I. Koyano)

Ion-molecule reactions	293
1. Introduction	293
2. Reaction rates	293
2.1 Microscopic reaction cross-section and rate coefficient	293
2.2 Activation energy and pre-exponential factor.	300
2.3 Phenomenological cross-section	301
3. Theory of ion-molecule reactions	304
3.1 Simple charge transfer	304
3.1.1 Resonant charge transfer	304
3.1.2 Non-resonant charge transfer	308
3.1.3 Accidental (or asymmetric) resonant charge transfer	310
3.2 Heavy particle transfer and the Langevin orbiting theory	310
3.3 Effect of permanent dipole on Langevin cross-section	314
3.4 Phase-space theory	316
3.5 Quasi-equilibrium theory	319
4. Dynamics and kinematic models of atom transfer reactions	320
4.1 Spectator stripping model	320
4.1.1 The first evidence. A simple experiment	321
4.1.2 Velocity spectra of forward scattered products	323
4.1.3 Measurements of angular distribution	326
4.1.4 Simultaneous measurements of angular and velocity distributions	326
4.1.5 Crossed beam experiments	329
4.2 Modification of spectator stripping	334
4.2.1 Polarization model	334
4.2.2 Energy considerations	335
4.2.3 DIPR model	337
4.2.4 Spectator stripping with reactant internal energy	339
4.2.5 Impulsive reaction model: angular distributions	341
4.3 Isotope effects.	344
4.4 Evidence for complex formation	347
4.4.1 Indirect evidence	348

4.4.2 Evidence from dynamic studies	349
4.5 Transition from complex to stripping	352
5. Energy effects on reaction channels and cross-sections	354
5.1 Effect of kinetic energy on exothermic reactions	355
5.2 Endothermic reaction and the problem of kinetic-to-internal energy transfer	358
5.2.1 Endothermic atom transfer	358
5.2.2 Endothermic charge transfer	368
5.2.3 Endothermic dissociative charge transfer	370
5.3 Effect of vibrational excitation in reactant ions	374
5.4 Effect of vibrational excitation in neutral reactants	378
5.5 Effect of electronic excitation in reactant ions	382
5.5.1 Abundances of excited ions	382
5.5.2 Reactions of electronically excited ions	385
5.6 Effect of rotational excitation	389
6. Reactions in some complex systems	391
6.1 Saturated hydrocarbons	391
6.1.1 Methane	391
6.1.2 Ethane	392
6.1.3 Propane	395
6.1.4 Butanes	397
6.1.5 H and H ₂ transfer	398
6.2 Alkenes	400
6.2.1 Ethylenes	400
6.2.2 Propene and cyclopropane	404
6.2.3 H ⁻ and H ₂ ⁻ transfer	409
6.2.4 The structure of C ₃ H ₆ ⁺ ions	410
6.2.5 Common features for higher olefins	412
6.3 Acetylene	419
References	421

Chapter 7 (G. Hughes and C. R. Lobb)

Reactions of solvated electrons	429
1. Introduction	429
2. The hydrated electron	429
2.1 Preparation of the hydrated electron	429
2.1.1 Radiation chemistry	429
2.1.2 Photolysis of aqueous solutions	433
2.1.3 Chemical methods	433
2.2 Properties of the hydrated electron	436
2.3 Reactions of the hydrated electron	439
2.3.1 Introduction	439
2.3.2 Inorganic anions	441
2.3.3 Inorganic neutral molecules	443
2.3.4 Inorganic metal cations	443
2.3.5 Organic compounds	446
2.3.6 Biological compounds	448
2.3.7 Reactions in concentrated solutions	449
3. The solvated electrons in other systems	450
3.1 The ammoniated electron	450
3.1.1 Preparation and properties	450

3.1.2 Reactions of the ammoniated electron	453
3.2 The solvated electron in amines	455
3.3 Other systems	456
Conclusion	458
References	458
Index	463
