Preface	xi
Chapter 1. Introduction	1
§1.1. The three classical linear PDEs	1
§1.2. Nonlinear PDEs	4
§1.3. Our choice of equations and the idea of modulation equations	6
§1.4. Overview	11
Part I Nonlinear dynamics in \mathbb{R}^d	
Chapter 2. Basic ODE dynamics	15
§2.1. Linear systems	17
§2.2. Local existence and uniqueness for nonlinear systems	34
§2.3. Special solutions	38
§2.4. ω -limit sets and attractors	49
§2.5. Chaotic dynamics	58
§2.6. Examples	64
Chapter 3. Dissipative dynamics	75
§3.1. Bifurcations	76
§3.2. Center manifold theory	85
§3.3. The Hopf bifurcation	91
§3.4. Routes to chaos	98
Chapter 4. Hamiltonian dynamics	109

§4.1. Basic properties	109
§4.2. Some celestial mechanics	116
§4.3. Completely integrable systems	121
§4.4. Perturbations of completely integrable systems	123
§4.5. Homoclinic chaos	128
Part II Nonlinear dynamics in countably many dimensions	
Chapter 5. PDEs on an interval	133
§5.1. From finitely to infinitely many dimensions	134
§5.2. Basic function spaces and Fourier series	151
§5.3. The Chafee-Infante problem	167
Chapter 6. The Navier-Stokes equations	179
§6.1. Introduction	179
§6.2. The equations on a torus	186
§6.3. Other boundary conditions and more general domains	197
Part III PDEs on the infinite line	
Chapter 7. Some dissipative PDE models	205
§7.1. The KPP equation	206
§7.2. The Allen-Cahn equation	222
§7.3. Intermezzo: Fourier transform	225
§7.4. The Burgers equation	237
Chapter 8. Three canonical modulation equations	249
§8.1. The NLS equation	250
§8.2. The KdV equation	259
§8.3. The GL equation	275
Chapter 9. Reaction-Diffusion systems	295
§9.1. Modeling, and existence and uniqueness	297
§9.2. Two classical examples	302
§9.3. The Turing instability	307
Part IV Modulation theory and applications	
Chapter 10. Dynamics of pattern and the GL equation	315
§10.1. Introduction	316

§10.2.	The Swift-Hohenberg equation	319
§10.3.	The universality of the GL equation	332
§10.4.	An abstract approximation result	337
§10.5.	Reaction-Diffusion systems	347
§10.6.	Convection problems	354
§10.7.	The Couette-Taylor problem	370
§10.8.	Attractors for pattern forming systems	378
§10.9.	Further remarks	395
Chapter 11.	Wave packets and the NLS equation	401
§11.1.	Introduction	402
§11.2.	Justification in case of cubic nonlinearities	404
§11.3.	The universality of the NLS equation	411
§11.4.	Quadratic nonlinearities	416
§11.5.	Extension of the theory	421
§11.6.	Pulse dynamics in photonic crystals	429
§11.7.	Nonlinear optics	440
Chapter 12.	Long waves and their modulation equations	451
§12.1.	An approximation result	452
§12.2.	The universality of the KdV equation	456
§12.3.	Whitham, Boussinesq, BBM, etc.	465
§12.4.	The long wave limit	468
Chapter 13.	Center manifold reduction and spatial dynamics	473
§13.1.	The center manifold theorem	473
§13.2.	Local bifurcation theory on bounded domains	478
§13.3.	Spatial dynamics for elliptic problems in a strip	482
§13.4.	Applications	484
Chapter 14.	Diffusive stability	497
§14.1.	Linear and nonlinear diffusive behavior	498
§14.2.	Diffusive stability of spatially periodic equilibria	507
§14.3.	The critical case	523
§14.4.	Phase diffusion equations	529
§14.5.	Dispersive dynamics	535
	Bibliography	541

List of symbols	567
Index	569
