<i>Preface (English)</i>	xix

PART I. GRAVITATION

<i>Course I. Gravitation and experiment, by T. Damour</i>	<i>1</i>
1. Introduction	5
2. Methodologies for testing theories	6
2.1. Phenomenological approach (“compare”)	7
2.2. Theory-space approach (“contrast”)	8
3. Testing what?	11
3.1. The two structural elements of general relativity	11
3.2. New, macroscopic fields and couplings	13
4. Testing the coupling of matter to an external gravitational field	14
4.1. Experimental consequences of universal metric coupling	14
4.2. Non-metric couplings and their observational consequences	17
4.2.1. Dilaton-like couplings	17
4.2.2. Multi-metric couplings, antisymmetric tensor couplings, and local Lorentz invariance	19
4.2.3. Other couplings of matter to scalar, vector, or tensor fields and their experimental consequences	22
4.3. Experimental results on the coupling of matter to an external gravitational field	24
4.4. Theoretical conclusions about the coupling of matter to an external gravitational field	26

5.	Testing the Newtonian and post-Newtonian limits of metric theories of gravity	28
5.1.	What are the most natural metric alternatives to Einstein's theory?	28
5.2.	The Newtonian limit of tensor–multi-scalar theories and its experimental tests	31
5.3.	The post-Newtonian limit of tensor–multi-scalar theories and its experimental tests	36
5.4.	Theoretical conclusions about weak-field, metric gravity	41
6.	Testing the strong and radiative gravitational field regimes	43
6.1.	Binary pulsars as laboratories for probing strong and radiative gravitational fields	43
6.2.	Phenomenological analysis of binary-pulsar data (“parametrized post-Keplerian formalism”)	45
6.3.	Theory-space approach to binary-pulsar tests: introduction of strong-field parameters $\beta_2, \beta', \beta'', \dots$	47
6.4.	Experimental constraints on strong-field relativistic gravity	50
7.	Other tests and conclusions	53
7.1.	Testing gravity on large scales	53
7.2.	Cosmological tests	54
7.3.	Other astrophysical tests and possible dark clouds	55
7.4.	Tests to come?	55
7.5.	Overall conclusions	56
	Appendix	57
	References	57

Course 2. Quantum field theory in curved space-time, by R.M. Wald 63

1.	Introduction and preliminaries	67
1.1.	Introduction and overview	67
1.2.	Classical dynamics of particle systems	71
1.3.	Quantum mechanics	74
1.4.	Harmonic oscillators	77
2.	Quantum fields in flat space-time	83
2.1.	Basic construction	83
2.2.	Reformulation	86
2.3.	Particle interpretation	93
3.	Quantum fields in curved space-time	97
3.1.	Curved space-time; global hyperbolicity	97
3.2.	Construction of quantum field theory in curved space-time	99
3.3.	Quantum field theory in stationary space-times	102
3.4.	Unitary equivalence; the S -matrix	105
3.5.	The algebraic approach	110
3.6.	The stress–energy tensor	118

4. The Unruh effect	129
4.1. The Unruh effect in flat space-time	129
4.2. Generalization to curved space-times	138
5. The Hawking effect	146
5.1. Particle creation by black holes	146
5.2. Ramifications	154
Appendix A. Some basic definitions and constructions pertaining to Hilbert spaces	160
A.1. Some basic definitions	161
A.2. Some basic constructions	162
A.3. Index notation	164
References	166

------------	-----

<i>Course 3. Mathematical problems of non-perturbative quantum general relativity, by A. Ashtekar</i>	181
---	-----

1. Introduction	185
1.1. The problem	185
1.2. Difficulties	188
1.2.1. Particle theorist's strategies	189
1.2.2. Mathematical physicist's methods	192
1.2.3. General relativist's approaches	194
1.3. Overview	197
2. Mathematical preliminaries	199
2.1. Symplectic framework	200
2.2. First class constraints	202
2.3. Dirac quantization program and its limitations	205
2.4. Algebraic quantization program	208
2.5. Connections and loops: a non-linear duality	211

3. Three faces of 2+1 quantum gravity	216
3.1. Introduction	216
3.2. Hamiltonian formulation	218
3.3. Timeless description: frozen formalism	223
3.4. Discrete elements: pre-geometry	227
3.5. Extracting time: dynamics unfolded	229
4. 3+1 General relativity as connection dynamics	233
4.1. Introduction	233
4.2. Hamiltonian framework	236
4.3. Rovelli–Smolin loop variables	242
5. The loop representation for 3+1 gravity	248
5.1. Introduction	248
5.2. The loop representation	251
5.3. Regularization and weaves	256
5.4. Quantum dynamics	265
5.5. Outlook	268
6. Discussion	272
6.1. Summary	272
6.2. Open issues and directions for the future	275
6.3. An evaluation	279
References	282

Course 4. Spacetime quantum mechanics and the quantum mechanics of spacetime, by J.B. Hartle 285

1. Introduction	289
2. The quantum mechanics of closed systems	294
2.1. Quantum mechanics and cosmology	294
2.2. Probabilities in general and probabilities in quantum mechanics	295
2.3. Probabilities for a time sequence of measurements	298
2.4. Post-Everett quantum mechanics	300
2.5. The origins of decoherence in our universe	307
2.6. The Copenhagen approximation	310
2.7. Quasiclassical domains	311
3. Decoherence in general, decoherence in particular, and the emergence of classical behavior	313
3.1. A more general formulation of the quantum mechanics of closed systems	313
3.1.1. Fine-grained and coarse-grained histories	314
3.1.2. The decoherence functional	316
3.1.3. Prediction, retrodiction, and states	318
3.1.4. The decoherence functional in path-integral form	320
3.2. The Emch model	322

3.3. Linear oscillator models	324
3.3.1. Specification	324
3.3.2. The influence phase and decoherence	325
3.4. The emergence of a quasiclassical domain	328
4. Generalized quantum mechanics	337
4.1. Three elements	337
4.2. Hamiltonian quantum mechanics as a generalized quantum mechanics	340
4.3. Sum-over-histories quantum mechanics for theories with a time	342
4.4. Differences between and equivalences of Hamiltonian and sum-over-histories quantum mechanics for theories with a time	344
4.5. Classical physics and the classical limit of quantum mechanics	346
4.6. Generalizations of Hamiltonian quantum mechanics	348
4.7. A time-neutral formulation of quantum mechanics	349
5. The spacetime approach to non-relativistic quantum mechanics	352
5.1. A generalized sum-over-histories quantum mechanics for non-relativistic systems	352
5.2. Evaluating path integrals	358
5.2.1. Product formulae	358
5.2.2. Phase-space path integrals	360
5.3. Examples of coarse grainings	361
5.3.1. Alternatives at definite moments of time	361
5.3.2. Alternatives defined by a spacetime region	363
5.3.3. A simple example of a decoherent spacetime coarse graining	365
5.4. Coarse grainings by functionals of the paths	367
5.4.1. General coarse grainings	367
5.4.2. Coarse grainings defining momentum	369
5.5. The relation between the Hamiltonian and generalized sum-over-histories formulations of non-relativistic quantum mechanics	371
6. Abelian gauge theories	373
6.1. Gauge and reparametrization invariance	373
6.2. Coarse grainings of the electromagnetic field	375
6.3. Specific examples	379
6.4. Constraints	380
6.5. ADM and Dirac quantization	383
7. Models with a single reparametrization invariance	387
7.1. Reparametrization invariance in general	387
7.2. Constraints and path integrals	391
7.3. Parametrized non-relativistic quantum mechanics	395
7.4. The relativistic world line – formulation with a preferred time	400
7.5. The relativistic world line – formulation without a preferred time	403
7.5.1. Fine-grained histories, coarse grainings, and decoherence functional	403
7.5.2. Explicit examples	409
7.5.3. Connection with field theory	411

7.5.4. No equivalent Hamiltonian formulation	413
7.5.5. The probability of the constraint	414
7.6. Relation to Dirac quantization	416
8. General relativity	420
8.1. General relativity and quantum gravity	420
8.2. Fine-grained histories of metric and fields and their simplicial approximation	422
8.3. Coarse grainings of spacetime	425
8.4. The decoherence functional for general relativity	429
8.4.1. Actions, invariance, constraints	430
8.4.2. Class operators	434
8.4.3. Adjoining initial and final conditions	437
8.5. Discussion – the problem of time	442
8.6. Discussion – constraints	444
8.7. Simplicial models	447
8.8. Initial and final conditions in quantum cosmology	451
9. Semiclassical predictions	453
9.1. The semiclassical regime	453
9.2. The semiclassical approximation to the quantum mechanics of a non-relativistic particle	454
9.3. The semiclassical approximation for the relativistic particle	458
9.4. The approximation of field theory in semiclassical spacetime	462
9.5. Rules for semiclassical prediction and the emergence of Hamiltonian quantum mechanics	467
10. Summary	469
Appendix A. Notation and conventions	474
References	475

PART II. QUANTUM MODELS

Course 5. Topics in string theory and quantum gravity,
by L. Alvarez-Gaumé and M.A. Vázquez-Mozo **481**

0. General introduction	485
1. Field-theoretical approach to quantum gravity	488
1.1. Linearized gravity	489
1.2. Supergravity	490
1.3. Kaluza–Klein theories	492
1.4. Quantum field theory and classical gravity	495
1.5. Euclidean approach to quantum gravity	503

1.6. Canonical quantization of gravity	508
1.7. Gravitational instantons	510
2. Consistency conditions: anomalies	512
2.1. Generalities about anomalies	512
2.2. Spinors in $2n$ dimensions	515
2.3. When can we expect to find anomalies?	519
2.4. The Atiyah–Singer index theorem and the computation of anomalies	524
2.5. Examples: Green–Schwarz cancellation mechanism and Witten’s SU(2) global anomaly	539
3. String theory I. Bosonic strings	542
3.1. Bosonic string	544
3.2. Conformal field theory	552
3.3. Quantization of the bosonic string	561
3.4. Interactions in string theory and the characterization of the moduli space	563
3.5. Bosonic strings with background fields. “Stringy” corrections to the Einstein equations	569
3.6. Toroidal compactifications. R -duality	571
3.7. Operator formalism	574
4. String theory II. Fermionic strings	598
4.1. Fermionic string	598
4.2. Heterotic string	613
4.3. Strings at finite temperature	616
4.4. Is string theory finite?	623
5. Other developments and conclusions	625
5.1. String phenomenology	625
5.2. Black holes and related subjects	627
References	629

Seminar 3. Solvable extensions of two-dimensional gravity, by P. van Nieuwenhuizen 637

1. Introduction	639
2. Chiral Yang–Mills theory	640
3. \mathcal{W}_3 gravity	642
References	645

Course 6. Closed-string field theory: an introduction, by B. Zwiebach 647

1. The origin of the string field	651
-----------------------------------	-----

2. String diagrams from an extremal problem	655
2.1. Two useful results	657
2.2. The minimal-area problem for closed-string theory	659
2.3. Why minimal-area metrics work	661
3. Batalin–Vilkovisky structures	664
3.1. Symplectic vector spaces	664
3.2. Ghost conformal field theory	666
3.3. Symplectic structure on $\mathcal{H}'_{\text{CFT}}$	667
3.3.1. Reflector state	667
3.3.2. A kinetic term for closed-string fields	668
3.3.3. Symplectic structure in $\mathcal{H}'_{\text{CFT}}$	671
3.3.4. BV structure in space-time	671
4. Recent developments	672
References	677

*Course 7. Simplicial quantum gravity and random lattices,
by F. David*

679

1. Introduction	683
2. Piecewise flat manifolds, Regge calculus, and dynamical triangulations	685
2.1. Simplicial manifolds and piecewise linear spaces	685
2.2. The dual complex and volume elements	688
2.3. Spin connection, spinors	689
2.4. Curvature and the Regge action (classical Regge calculus)	690
2.5. Topological invariants	691
2.6. Simplicial Euclidean quantum gravity (quantum Regge calculus)	692
2.7. Dynamical triangulations (DT)	693
3. Two-dimensional gravity, dynamical triangulations, and matrix models	695
3.1. Continuum formulation of 2D gravity	696
3.2. Dynamical triangulations and continuum limit	700
3.3. The one-matrix model	703
3.4. Various matrix models	706
3.4.1. General potential	706
3.4.2. Symmetric matrix model	707
3.4.3. Multi-matrix models	708
3.4.4. d -Dimensional bosonic string	709
3.5. Numerical studies of 2D gravity	711
3.5.1. Series expansions	711
3.5.2. Monte Carlo simulations	712
3.5.3. Sampling methods using exact results	714
3.5.4. 2D quantum Regge calculus	714

3.6. The $c = 1$ barrier	715
3.6.1. Surfaces versus branched polymers	715
3.6.2. Tachyons for the bosonic string	716
3.6.3. Spikes/wormholes picture	717
3.6.4. Numerical studies of the $c > 1$ phase	718
3.7. Intrinsic geometry of 2D gravity	720
3.8. Liouville theory at $c > 25$	722
4. Euclidean quantum gravity at $D > 2$	723
4.1. What are we looking for?	723
4.2. Simplicial 3D gravity	725
4.3. Simplicial 4D gravity	729
4.4. 3D and 4D quantum Regge calculus	730
5. Non-perturbative problems in 2D quantum gravity	730
5.1. The continuum double-scaling limit	730
5.2. The Painlevé I string equation	733
5.3. Non-perturbative properties of the string equation	735
5.4. Divergent series and Borel summability	738
5.5. Non-perturbative effects in 2D gravity and string theories	741
5.6. Various stabilization proposals	743
5.6.1. Stochastic quantization	744
5.6.2. Complex matrix models	745
5.6.3. Complex solutions	745
6. Conclusion	746
References	746

Course 8. Matrix models of two-dimensional quantum gravity, by E. Brézin 751

1. Discretized strings and matrix models	755
2. Scaling laws	757
3. Matrix integrals in the large- N planar limit	759
4. Beyond the planar limit: recursion formulae	763
5. String equations for one-matrix models	765
6. Correlation functions	769
7. Multi-matrix models	771
8. The $c = 1$ string and free fermions	774
9. Beyond $c = 1$	779
References	780

Course 9. A few projects in string theory, by A.M. Polyakov 783

1. Introduction	787
-----------------	-----

2. Quantum gravity	787
3. Phases in gravity	789
4. Self-tuning universe	790
5. The dilaton	792
6. The Big Bang	793
7. Fuzzy strings and 3D Ising model	795
8. The QCD string	798
9. Scale dependence in quantum gravity	800
10. Conclusions	803
References	804

Course 10. Non-commutative geometry and physics,
by A. Connes 805

Introduction	809
1. The involutive algebra of coordinates on a quantum space X	816
2. Measure theory and representations	827
2.1. The GNS construction	828
2.2. The commutative case	830
2.3. The modular theory	831
2.4. The classification of factors	834
2.5. The KMS condition and quantum-statistical mechanics	835
3. C^* -algebras and topology	838
4. Vector bundles and cyclic cohomology	847
4.1. The Gauss–Bonnet theorem	847
4.2. Vector bundles and idempotents	849
4.3. Invariants of vector bundles	851
4.4. Vector bundles over quantum spaces	853
4.5. K -theory	854
4.6. Cyclic cohomology	856
5. The quantized calculus	862
5.1. Example 1: $\int f(Z) dZ ^p$	868
5.1.1. Hausdorff measure and the Caratheodory construction	873
5.2. Example 2: $\int E dE dE \in \mathbb{Z}$	876
5.3. Example 3: the trace of the metric	881
6. The metric aspect and classical matter fields	892
6.1. Riemannian manifolds and the Dirac operator	894
6.2. Product of continuum and discrete, and the symmetry breaking mechanism	908
6.2.1. Example (a): two-point space	910
6.2.2. Example (b): (four-dimensional Riemannian manifold M) \times (two-point space X)	915

7. The notion of manifold in non-commutative geometry	925
7.1. The classical notion of manifold	925
7.2. The KO orientation of a manifold	926
7.3. Fredholm modules and K -homology	928
7.4. Poincaré duality in K -homology and non-commutative C^* -algebras	929
7.5. Non-commutative manifolds	932
8. Geometric interpretation of the standard model	933
8.1. The standard model	934
8.2. Geometric structure of the finite space F	937
8.3. Geometric structure of the standard model	941
8.4. Unimodularity condition and hypercharges	945
References	948
