

CONTENTS

Preface xi
Bertfried Fauser, Jürgen Tolksdorf and Eberhard Zeidler

Quantum Gravity – A Short Overview 1
Claus Kiefer

- 1. Why do we need quantum gravity? 1
- 2. Quantum general relativity 5
 - 2.1. Covariant approaches 5
 - 2.2. Canonical approaches 5
 - 2.2.1. Quantum geometrodynamics 6
 - 2.2.2. Connection and loop variables 7
- 3. String theory 8
- 4. Loops versus strings – a few points 9
- 5. Quantum cosmology 10
- 6. Some central questions about quantum gravity 11

References 12

The Search for Quantum Gravity 15
Claus Lämmerzahl

- 1. Introduction 15
- 2. The basic principles of standard physics 16
- 3. Experimental tests 17
 - 3.1. Tests of the universality of free fall 17
 - 3.2. Tests of the universality of the gravitational redshift 18
 - 3.3. Tests of local Lorentz invariance 19
 - 3.3.1. Constancy of c 20
 - 3.3.2. Universality of c 21
 - 3.3.3. Isotropy of c 21
 - 3.3.4. Independence of c from the velocity of the laboratory 21
 - 3.3.5. Time dilation 21
 - 3.3.6. Isotropy in the matter sector 22
 - 3.4. Implications for the equations of motion 22
 - 3.4.1. Implication for point particles and light rays 22
 - 3.4.2. Implication for spin- $\frac{1}{2}$ particles 23
 - 3.4.3. Implications for the Maxwell field 23
 - 3.4.4. Summary 24
 - 3.5. Implications for the gravitational field 24
 - 3.6. Tests of predictions – determination of PPN parameters 25
 - 3.6.1. Solar system effects 25
 - 3.6.2. Strong gravity and gravitational waves 27

4. Unsolved problems: first hints for new physics?	27
5. On the magnitude of quantum gravity effects	29
6. How to search for quantum gravity effects	30
7. Outlook	31
Acknowledgements	32
References	32
Time Paradox in Quantum Gravity	41
<i>Alfredo Macías and Hernando Quevedo</i>	
1. Introduction	41
2. Time in canonical quantization	43
3. Time in general relativity	45
4. Canonical quantization in minisuperspace	49
5. Canonical quantization in midisuperspace	51
6. The problem of time	52
7. Conclusions	56
Acknowledgements	57
References	57
Differential Geometry in Non-Commutative Worlds	61
<i>Louis H. Kauffman</i>	
1. Introduction to non-commutative worlds	61
2. Differential geometry and gauge theory in a non-commutative world	66
3. Consequences of the metric	69
Acknowledgements	74
References	74
Algebraic Approach to Quantum Gravity III: Non-Commutative Riemannian Geometry	77
<i>Shahn Majid</i>	
1. Introduction	77
2. Reprise of quantum differential calculus	79
2.1. Symplectic connections: a new field in physics	81
2.2. Differential anomalies and the origin of time	82
3. Classical weak Riemannian geometry	85
3.1. Cotorsion and weak metric compatibility	86
3.2. Framings and coframings	87
4. Quantum bundles and Riemannian structures	89
5. Quantum gravity on finite sets	94
6. Outlook: Monoidal functors	97
References	98
Quantum Gravity as a Quantum Field Theory of Simplicial Geometry	101
<i>Daniele Oriti</i>	
1. Introduction: Ingredients and motivations for the group field theory	101
1.1. Why path integrals? The continuum sum-over-histories approach	102

1.2. Why topology change? Continuum 3rd quantization of gravity	103
1.3. Why going discrete? Matrix models and simplicial quantum gravity	105
1.4. Why groups and representations? Loop quantum gravity/spin foams	107
2. Group field theory: What is it? The basic GFT formalism	109
2.1. A discrete superspace	109
2.2. The field and its symmetries	111
2.3. The space of states or a third quantized simplicial space	112
2.4. Quantum histories or a third quantized simplicial spacetime	112
2.5. The third quantized simplicial gravity action	113
2.6. The partition function and its perturbative expansion	114
2.7. GFT definition of the canonical inner product	115
2.8. Summary: GFT as a general framework for quantum gravity	116
3. An example: 3d Riemannian quantum gravity	117
4. Assorted questions for the present, but especially for the future	120
Acknowledgements	124
References	125
An Essay on the Spectral Action and its Relation to Quantum Gravity	127
<i>Mario Paschke</i>	
1. Introduction	127
2. Classical spectral triples	130
3. On the meaning of noncommutativity	134
4. NC description of the standard model: the physical intuition behind it	136
4.1. The intuitive idea: an picture of quantum spacetime at low energies	136
4.2. The postulates	138
4.3. How such a noncommutative spacetime would appear to us	139
5. Remarks and open questions	140
5.1. Remarks	140
5.2. Open problems, perspectives, more speculations	141
5.3. Comparison: intuitive picture/other approaches to Quantum Gravity	143
6. Towards a quantum equivalence principle	145
6.1. Globally hyperbolic spectral triples	145
6.2. Generally covariant quantum theories over spectral geometries	147
References	149
Towards a Background Independent Formulation of Perturbative Quantum Gravity	151
<i>Romeo Brunetti and Klaus Fredenhagen</i>	
1. Problems of perturbative Quantum Gravity	151
2. Locally covariant quantum field theory	152
3. Locally covariant fields	155
4. Quantization of the background	158

References	158
Mapping-Class Groups of 3-Manifolds	161
<i>Domenico Giulini</i>	
1. Some facts about Hamiltonian general relativity	161
1.1. Introduction	161
1.2. Topologically closed Cauchy surfaces	163
1.3. Topologically open Cauchy surfaces	166
2. 3-Manifolds	169
3. Mapping class groups	172
3.1. A small digression on spinorality	174
3.2. General Diffeomorphisms	175
4. A simple yet non-trivial example	183
4.1. The \mathbb{RP}^3 geon	183
4.2. The connected sum $\mathbb{RP}^3 \uplus \mathbb{RP}^3$	185
5. Further remarks on the general structure of $\mathcal{G}_F(\Sigma)$	190
6. Summary and outlook	192
Appendix: Elements of residual finiteness	193
References	197
Kinematical Uniqueness of Loop Quantum Gravity	203
<i>Christian Fleischhack</i>	
1. Introduction	203
2. Ashtekar variables	204
3. Loop variables	205
3.1. Parallel transports	205
3.2. Fluxes	205
4. Configuration space	206
4.1. Semianalytic structures	206
4.2. Cylindrical functions	207
4.3. Generalized connections	207
4.4. Projective limit	207
4.5. Ashtekar-Lewandowski measure	208
4.6. Gauge transforms and diffeomorphisms	208
5. Poisson brackets	208
5.1. Weyl operators	209
5.2. Flux derivations	209
5.3. Higher codimensions	209
6. Holonomy-flux *-algebra	210
6.1. Definition	210
6.2. Symmetric state	210
6.3. Uniqueness proof	211
7. Weyl algebra	212
7.1. Definition	212
7.2. Irreducibility	213

7.3. Diffeomorphism invariant representation	213
7.4. Uniqueness proof	213
8. Conclusions	215
8.1. Theorem – self-adjoint case	215
8.2. Theorem – unitary case	215
8.3. Comparison	216
8.4. Discussion	216
Acknowledgements	217
References	218
Topological Quantum Field Theory as Topological Quantum Gravity	221
<i>Kishore Marathe</i>	
1. Introduction	221
2. Quantum Observables	223
3. Link Invariants	224
4. WRT invariants	226
5. Chern-Simons and String Theory	227
6. Conifold Transition	228
7. WRT invariants and topological string amplitudes	229
8. Strings and gravity	232
9. Conclusion	233
Acknowledgements	234
References	234
Strings, Higher Curvature Corrections, and Black Holes	237
<i>Thomas Mohaupt</i>	
1. Introduction	237
2. The black hole attractor mechanism	240
3. Beyond the area law	244
4. From black holes to topological strings	247
5. Variational principles for black holes	250
6. Fundamental strings and ‘small’ black holes	253
7. Dyonic strings and ‘large’ black holes	256
8. Discussion	258
Acknowledgements	259
References	260
The Principle of the Fermionic Projector: An Approach for Quantum Gravity?	263
<i>Felix Finster</i>	
1. A variational principle in discrete space-time	264
2. Discussion of the underlying physical principles	266
3. Naive correspondence to a continuum theory	268
4. The continuum limit	270
5. Obtained results	271

6. Outlook: The classical gravitational field	272
7. Outlook: The field quantization	274
References	280
Gravitational Waves and Energy Momentum Quanta	283
<i>Tekin Dereli and Robin W. Tucker</i>	
1. Introduction	283
2. Conserved quantities and electromagnetism	285
3. Conserved quantities and gravitation	286
4. The Bel-Robinson tensor	287
5. Wave solutions	289
6. Conclusions	291
References	292
Asymptotic Safety in Quantum Einstein Gravity:	
Nonperturbative Renormalizability and Fractal Spacetime Structure	293
<i>Oliver Lauscher and Martin Reuter</i>	
1. Introduction	293
2. Asymptotic safety	294
3. RG flow of the effective average action	296
4. Scale dependent metrics and the resolution function $\ell(\mathbf{k})$	300
5. Microscopic structure of the QEG spacetimes	304
6. The spectral dimension	307
7. Summary	310
References	311
Noncommutative QFT and Renormalization	315
<i>Harald Grosse and Raimar Wulkenhaar</i>	
1. Introduction	315
2. Noncommutative Quantum Field Theory	316
3. Renormalization of ϕ^4 -theory on the 4D Moyal plane	318
4. Matrix-model techniques	323
