## Contents

Preface	vii
Chapter 1. Introduction	1
Chapter 2. The example of the GUE	9
<ul><li>Chapter 3. Wigner random matrices</li><li>3.1. Law of large numbers: Light tails</li><li>3.2. Law of large numbers: Heavy tails</li><li>3.3. CLT</li></ul>	19 19 26 30
<ul> <li>Chapter 4. Beta-ensembles</li> <li>4.1. Law of large numbers and large deviation principles</li> <li>4.2. Concentration of measure</li> <li>4.3. The Dyson-Schwinger equations</li> <li>4.4. Expansion of the partition function</li> <li>4.5. The Stieltjes transforms approach</li> </ul>	35 35 42 46 54 57
<ul> <li>Chapter 5. Discrete beta-ensembles</li> <li>5.1. Large deviations, law of large numbers</li> <li>5.2. Concentration of measure</li> <li>5.3. Nekrasov's equations</li> <li>5.4. Second order expansion of linear statistics</li> <li>5.5. Expansion of the partition function</li> </ul>	63 64 66 68 75 76
<ul><li>Chapter 6. Continuous beta-models: The several cut case</li><li>6.1. The fixed filling fractions model</li><li>6.2. Central limit theorem for the full model</li></ul>	79 80 88
<ul> <li>Chapter 7. Several matrix-ensembles</li> <li>7.1. Non-commutative derivatives</li> <li>7.2. Non-commutative Dyson-Schwinger equations</li> <li>7.3. Independent GUE matrices</li> <li>7.4. Several interacting matrices models</li> <li>7.5. Second order expansion for the free energy</li> </ul>	91 92 93 93 93 95 106
Chapter 8. Universality for beta-models	117
Bibliography	137
Index	143
