

Index	Page
1 Introduction.....	1
2 State of the art and research	3
2.1 Basics	3
2.1.1 Additive Manufacturing (AM).....	3
2.1.2 Polymer laser sintering (LS).....	7
2.1.3 Polyamide 12 (PA12).....	9
2.2 Analysis of thermal processes during LS	11
2.2.1 Powder recoating and preheating	13
2.2.2 Laser energy input	15
2.2.3 Cooling process and material solidification	18
2.3 Ageing and recycling of PA12 in LS	21
2.3.1 Ageing mechanisms and specification	21
2.3.2 Material recycling and qualification	23
2.3.3 Long-time ageing behavior.....	25
2.3.4 Modelling of ageing effects	26
2.4 Thermal conductivity of packed beds	27
2.5 Thermal Finite Element (FE) analysis	29
2.5.1 Theoretical basics	29
2.5.2 Application on the LS process.....	30
3 Research gap and outline of this work.....	33
4 Experimental analysis of thermal histories within LS part cakes	35
4.1 Implementation of a temperature measurement system.....	35
4.1.1 Requirements.....	35
4.1.2 Design and Assembly	36
4.1.3 Functional tests.....	39
4.1.3.1 Reproducibility	40
4.1.3.2 Symmetry of the temperature distribution	40
4.1.3.3 Limitations.....	41
4.2 Basic temperature distributions and histories	42
4.2.1 Process phase overview	42
4.2.2 Build phase	44
4.2.3 Cooling phase.....	47
4.3 Influence of process and build job parameters	50

4.3.1	Build height	50
4.3.2	Part packing ratio	52
4.3.3	Layer thickness / Build speed / Powder bed density	54
4.3.4	Powder quality	58
4.4	Summary and discussion	59
5	Simulation of heat transfer within part cakes in LS	61
5.1	Model development	61
5.1.1	Geometry	62
5.1.2	Boundary conditions	62
5.1.3	Material parameters	65
5.2	Parameter identification study	66
5.2.1	Approach	66
5.2.2	Results	68
5.2.3	Validation and optimization	69
5.3	Model application	71
5.3.1	Influence of the powder bed density	71
5.3.1.1	Derivation of thermal conductivities	71
5.3.1.2	Sensitivity analysis: Influences on required cooling time	73
5.3.1.3	Comparison to the ZBS model	74
5.3.2	Influence of varied ambient temperatures during cooling	76
5.4	Summary and discussion	77
6	Ageing kinetics of PA12	79
6.1	Motivation: Process ageing distribution	80
6.2	Oven ageing experiments	82
6.3	Ageing model development	85
6.3.1	Arrhenius model	86
6.3.2	Extended exponential model	88
6.4	Ageing model application on individual thermal histories during LS	90
6.4.1	Extraction of relevant thermal histories	91
6.4.2	Calculation of a delta-MVR-matrix	91
6.4.3	Results	93
6.5	Validation	94
6.6	Ageing model application: Influence of build height	96
6.7	Summary and discussion	97
7	Analysis of a recycling optimized material – PA 2221	99
7.1	Particle analysis	100
7.2	Specification of the powder age	102

7.3	Long-time process ageing	106
7.3.1	Experimental set-up	106
7.3.2	Material analysis	108
7.3.3	Part analysis	110
7.3.3.1	Tensile properties	111
7.3.3.2	Density	111
7.3.3.3	Warping intensity	112
7.3.3.4	Surface quality	113
7.4	Advanced material and part analysis.....	114
7.4.1	Experimental set-up	114
7.4.2	Part analysis	117
7.4.2.1	Tensile properties	118
7.4.2.2	Bending properties	120
7.4.2.3	Compression properties	121
7.4.3	Material analysis	122
7.4.3.1	In-process ageing	122
7.4.3.2	Powder bed density	123
7.5	Summary and discussion	124
8	Influence of thermal histories on resulting part properties	127
8.1	Analysis of actual cooling rates dependent on build speed and z-height.....	127
8.2	Experimental set-up	129
8.2.1	Pre-investigations: Influences on the dimensional accuracy	129
8.2.2	Layer and exposure speed analysis	132
8.2.3	Final exposure strategy and build job layouts	133
8.3	Results	135
8.3.1	Part size	135
8.3.2	Part density	137
8.3.3	Tensile properties	138
8.4	Summary and discussion	140
9	Summary and outlook	143
10	References	145
