<i>Preface</i>	viii
<i>Acknowledgments</i>	xi
1 Introduction	1
1.1 <i>Causal modeling and observation plans</i>	3
1.1.1 Cross-sectional data	4
1.1.2 Panel data	11
1.1.3 Event history data	17
1.2 <i>Event history analysis and causal modeling</i>	19
1.2.1 Causal explanations	19
1.2.2 Transition rate models	28
2 Event history data structures	41
2.1 <i>Basic terminology</i>	41
2.2 <i>Event history data organization</i>	45
2.2.1 Using event history data files with Stata	49
2.2.2 Executing Stata with a do-file	51
2.2.3 Single episode data	54
2.2.4 Multiepisode data	57
3 Nonparametric descriptive methods	63
3.1 <i>Life table method</i>	63
3.2 <i>Product-limit estimation</i>	76
3.3 <i>Comparing survivor functions</i>	80
4 Exponential transition rate models	95
4.1 <i>The basic exponential model</i>	96
4.1.1 Maximum likelihood estimation	97
4.1.2 Models without covariates	99
4.1.3 Time-constant covariates	102
4.2 <i>Models with multiple destinations</i>	108
4.3 <i>Models with multiple episodes</i>	116

5	Piecewise constant exponential models	124
	5.1 The basic model	124
	5.2 Models without covariates	126
	5.3 Models with proportional covariate effects	130
	5.4 Models with period-specific effects	132
6	Exponential models with time-dependent covariates	137
	6.1 Parallel and interdependent processes	137
	6.2 Interdependent processes: the system approach	139
	6.3 Interdependent processes: the causal approach	142
	6.4 Episode splitting with qualitative covariates	144
	6.5 Episode splitting with quantitative covariates	155
	6.6 Application examples	160
7	Parametric models of time dependence	192
	7.1 Interpretation of time dependence	193
	7.2 Gompertz models	196
	7.3 Weibull models	204
	7.4 Log-logistic models	212
	7.5 Log-normal models	218
	7.6 Conclusion: Estimating time-dependent models with Stata	223
8	Methods to check parametric assumptions	224
	8.1 Simple graphic methods	224
	8.2 Pseudoresiduals	226
9	Semiparametric transition rate models	231
	9.1 Partial likelihood estimation	232
	9.2 Time-dependent covariates	236
	9.3 The proportionality assumption	239
	9.4 Stratification with covariates and for multiepisode data	243
	9.5 Baseline rates and survivor functions	248
	9.6 Application example	251
10	Problems of model specification	256
	10.1 Unobserved heterogeneity	256
	10.2 Models with a mixture distribution	261
	10.2.1 Models with a gamma mixture	264
	10.2.2 Exponential models with a gamma mixture	267
	10.2.3 Weibull models with a gamma mixture	269
	10.2.4 Random effects for multiepisode data	273
	10.3 Discussion	276

11 Introduction to sequence analysis	282
BRENDAN HALPIN	
11.1 Defining distances	284
11.2 Doing sequence analysis in Stata	287
11.3 Unary summaries	289
11.4 Intersequence distance	291
11.5 What to do with sequence distances?	293
11.6 Optimal matching distance	296
11.7 Special topics	297
11.8 Conclusion	305
Appendix: exercises	308
References	320
About the authors	344
