<b>Chapter 1 Analysing casualty records</b>	<b>1</b>
How big is a catastrophe?	1
Perspectives	2
Collective skills	5
Exponential fall in accident rates	7
The gradient $b$	8
The mechanical case	9
The learning process	12
Perturbations	14
Cause and effect	16
Conclusions	18
References	18
<b>Chapter 2 Accident and all-cause mortality: economic growth</b>	<b>19</b>
The effect of sex and age group	19
Industry and transport: the normal case	22
Exceptions	38
Changing human behaviour	47
National productivity and accident rates	48
Conclusions	49
References	52
<b>Chapter 3 Supercatastrophes</b>	<b>54</b>
Shipping accidents	54
Catastrophes in the oil and gas production industry	77

Catastrophes involving air travel	103
The chemical industry	120
Rail accidents	127
Comment	133
References	137
<b>Chapter 4 The technical background</b>	<b>139</b>
Mechanical failure	139
Catastrophes resulting from the brittle failure of steel	152
Fatigue cracking	165
Other types of fracture	172
Theoretical aspects of explosions	179
References	189
<b>Chapter 5 How technological change affects safety</b>	<b>191</b>
The role of the material	192
Air transport	202
Shipping	212
The oil and gas industry	219
Hydrocarbon processing	227
Land transport	232
References	234
<b>Chapter 6 Natural catastrophes</b>	<b>235</b>
Natural catastrophes and a country's level of productivity	235
The effects of natural disasters	238
Earthquakes	243
References	253
<b>Appendix I: Mathematical models and statistical methods for accident data</b>	<b>254</b>
The trend curve	254
Linear regression	254
Non-dimensional forms of the trend curve	256
Casualty numbers	256
Hyperbolic models	257
Variance	257
The Gaussian frequency distribution	258
The spread of data	259
The neutral case	260

**Appendix 2: Units**

Abbreviations	<b>262</b>
Conversion factors	262
	263
<i>Index</i>	265
