

CONTENTS

- I. *Introduction* page 1
(1) The question posed for the thirteenth-century natural philosophers by the Greeks (1-3). (2) Method in Greek science (3-8) and (3) in medieval science (8-15).
- II. *Empiricism and Rationalism in Twelfth-Century Science* 16
(1) The empiricism of the practical arts (16-18); interest of scholars in practical science (18-21); influence on the teaching of the seven liberal arts (21-24): Hugh of St. Victor (21-22). (2) Rationalism in twelfth-century philosophy (24-35); Aristotle's theory of the two-fold, inductive-deductive process in scientific argument (25-27); Galen (27); 'resolution and composition' (28-29); Peter Abelard's rationalism (29-31); twelfth-century mathematics (31-32); Hugh of St. Victor (32-34); problem of induction (34-35). (3) The effect of the translations from Greek and Arabic (35-43): Dominicus Gundissalinus (36-40); English writers (40-43).
- III. *Grosseteste's Writings on Theory of Science* 44
(1) Dates of Grosseteste's writings (44-52). (2) Foundations of his theory of science (52-60).
- IV. *Induction, and Verification and Falsification in Natural Science* 61
(1) Induction and definition: Grosseteste's theory of 'resolution and composition' (61-74); its sources, Greek and Arabic (74-81). (2) His theory of experimental verification and falsification (81-90): application in problems of heat (87), stars (88), comets (88-90).
- V. *Mathematical Physics* 91
(1) Grosseteste's theory of mathematical physics (91-104): subordination (91-94); in optics (91-96); in astronomy (92-94, 96-98); vacuum (99); measurement (99-104); infinity (99-103). (2) His cosmology of light (104-16): infinite aggregates (108); 'multiplication of species', mathematical explanations (109-16); colour (111); tides (112); propagation of light (113-16). (3) His optics, including his theory of the rainbow (116-27).
- VI. *Metaphysics of Light* 128
(1) Grosseteste's theory of Divine illumination and certainty (128-31).
(2) Summary of Grosseteste's contributions to the theory of experimental science (132-4).

- VII. *Grosseteste and the Oxford School* 135
 (1) Grosseteste's relations with the Oxford Franciscans: Adam Marsh, Thomas of York, Thomas Docking (137-8); Bartholomew the Englishman (138); Robert Kilwardby (138-9). (2) Roger Bacon: theory of experiment (139-42); mathematics and the world of experience (143-4); multiplication of species (144-8); theory of heat, optics, and theory of vision (149-55); theories of the rainbow and halo (155-62). (3) The *Summa Philosophiae* of pseudo-Grosseteste (162-4); John Pecham's optics (165-7). (4) Scientific method of John Duns Scotus (167-71) and William of Ockham (171-5); Ockham's dynamics (175-7). (5) Mathematical functions and graphs: Thomas Bradwardine (177-81); John of Dumbleton's use of 'latitude of forms' (181-6), optics (183-6); other fourteenth-century Oxford writers (186-8).
- VIII. *Grosseteste, Oxford and European Science* 189
 (1) Grosseteste's relations with continental scholars: Albertus Magnus (189-200); his theories of science (192-5), of heat (195-6), of the rainbow (196-200). (2) Grosseteste, Roger Bacon and French astronomy (200-4). (3) Roger Bacon and Petrus Peregrinus (204-7); *De Magnete* (207-10); later work on magnetism (210-12). (4) Grosseteste, Roger Bacon, and Witelo (213-18); Witelo's experiments with the parabolic mirror (218-19); measurements of angles of refraction (219-26); theory of the rainbow (226-30); experiments on the production of colours by crystals (230-2).
- IX. *Experimental Method and Theodoric of Freiberg's Explanation of the Rainbow* 233
 (1) Summary of thirteenth-century work on the rainbow (234-6); Theodoric's knowledge of this work (237-9); ideas on method (239-41); contents of *De Iride* (241-2). (2) Theodoric's theory of light and colour and experiments with refraction in crystals and spherical balls (242-8). (3) Theodoric's theory of the rainbow: three fundamental discoveries (248-51); theory of the primary rainbow (251-5); theory of the secondary rainbow (255-9).
- X. *Experimental Method and the Transmission of Thirteenth- and Fourteenth-century Writings on the Rainbow, Colour, and Light to the Seventeenth Century* 260
 (1) Berthold of Mosberg (260); Themon Judaei and his explanation of the rainbow (261-8). (2) Knowledge of Theodoric of Freiberg and Themon Judaei in the fifteenth and sixteenth centuries (268-70); Francesco Maurolyco (271-2), Marc Antonio de Dominis (272-3), and Descartes (273-5) on the rainbow; Newton's theory of colour (275-7). (3) Influence of thirteenth- and fourteenth-century optical writings in the fifteenth-seventeenth centuries (277-9); invention of the telescope and compound microscope (279-80); theory of vision (280-2); law of refraction (282-4); primary and secondary qualities (285-7); theories of propagation of light and of the nature of colour (285-9).

XI. <i>The Historical Foundations of the Modern Theory of Experimental Science</i>	290
(1) Summary of the main features of the thirteenth- and fourteenth-century experimental method (290-6). (2) Scientific method in fifteenth- and sixteenth-century Padua (296-300); Francis Bacon (300-3); Galileo (303-10); Descartes (310-15); Newton (315-18); conclusion (318-19).
