

Contents

Chapter 1. General introduction	1
Chapter 2. Derivation of the weakly nonlinear amplitude equation	11
2.1. The variational setting: assumptions	11
2.2. Weakly nonlinear asymptotics	16
2.3. Isotropic elastodynamics	26
2.4. Well-posedness of the amplitude equation	35
Chapter 3. Existence of exact solutions	41
3.1. Introduction	41
3.2. The basic estimates for the linearized singular systems	53
3.3. Uniform time of existence for the nonlinear singular systems	62
3.4. Singular norms of nonlinear functions	67
3.5. Uniform higher derivative estimates and proof of Theorem 3.7	75
3.6. Local existence and continuation for the singular problems with ε fixed	93
Chapter 4. Approximate solutions	105
4.1. Introduction	105
4.2. Construction of the leading term and corrector	108
Chapter 5. Error Analysis and proof of Theorem 3.8	115
5.1. Introduction	115
5.2. Building block estimates	119
5.3. Forcing estimates	123
5.4. Estimates of the extended approximate solution	127
5.5. Endgame	128
Chapter 6. Some extensions	135
6.1. Extension to general isotropic hyperelastic materials.	135
6.2. Extension to wavetrains.	136
6.3. The case of dimensions $d \geq 3$.	138
Appendix A. Singular pseudodifferential calculus for pulses	141
A.1. Symbols	141
A.2. Definition of operators and action on Sobolev spaces	142
A.3. Adjoints and products	143
A.4. Extended calculus	144
A.5. Commutator estimates	145
Bibliography	149
