Preface and acknowledgements xiv
Notation guide xix

1. Introduction: competing theories of production, growth and distribution 1
1.1 Introduction: growth and growth theory in perspective 1
1.2 Some basic definitions and concepts 3
1.3 Competing visions of growth 7
1.3.1 The neoclassical, classical-Marxian and post-Keynesian visions of growth 7
1.3.2 Alternative approaches to production, technical change and potential output 10
1.4 Competing models of growth: a preliminary overview 22
1.4.1 The neoclassical tradition 23
1.4.2 The heterodox tradition: classical-Marxian and post-Keynesian theory 33
1.5 Reconciling aggregate demand and aggregate supply in the theory of long-run growth 38
1.5.1 Say's law versus 'Say's law in reverse' 38
1.5.2 Interactions between demand and supply 38
1.6 Why study heterodox theories of growth and distribution? 43
1.7 Conclusions and outline of the book 46

PART I CORE MODELS OF GROWTH AND DISTRIBUTION

2. Classical-Marxian models 58
2.1 Introduction 58
2.2 Basic accounting framework and distributional relationships 59
2.3 Saving behaviour and distributional closures 63
2.4 Model solutions under alternative closures 68
2.4.1 An exogenously given real wage 68
2.4.2 An exogenously given wage share 70
2.4.3 Natural rate of growth, or a constant unemployment rate 70
2.4.4 An exogenously given rate of profit 73

Blecker, Robert A.
Heterodox macroeconomics

digitalisiert durch:
IDS Basel Bern

2.5 Effects of exogenous changes in saving propensities or income distribution 74
2.5.1 Redistribution of income 74
2.5.2 An increased propensity to save 76
2.6 Technological change 79
2.6.1 Types of technological change 80
2.6.2 A note on the choice of technique 82
2.6.3 Neutral technical changes under alternative distributional closures 83
2.6.4 Marx-biased technical change and the falling tendency of the rate of profit 87
2.7 The Ricardian stationary state 90
2.8 Neo-Marxian Goodwin cycles and the profit-squeeze hypothesis 94
2.9 Conclusions 97

3. Neo-Keynesian models 103
3.1 Introduction 103
3.2 Harrod's model of unstable growth 105
3.2.1 Three growth rates 106
3.2.2 The first and second Harrod problems 109
3.2.3 The importance of expectations for the second Harrod problem 114
3.2.4 Another look at Harrodian instability 117
3.2.5 Interaction of the first and second Harrod problems and the properties of Harrodian growth outcomes 120
3.2.6 Are the Harrod problems more apparent than real? 121
3.3 The early Kaldorian model of growth and distribution 123
3.3.1 The Pasinetti and neo-Pasinetti theorems 128
3.4 The neo-Robinsonian model of profits and growth 131
3.4.1 Saving, investment and the equilibrium growth rate 132
3.4.2 Connecting accumulation back to distribution 135
3.4.3 The long-run paradox of thrift and the underlying price mechanism 137
3.4.4 Animal spirits and the 'widow's cruse' 139
3.5 Real wage resistance and inflation 141
3.5.1 Marglin's neo-Marxian/neo-Keynesian synthesis 142
3.6 Conclusions 148
Appendix 3.1 Pasinetti after Samuelson and Modigliani 155
Appendix 3.2 A note on Robinson's original presentation 156

4. Neo-Kaleckian models 158
4.1 Introduction 158
4.2 Kaleckian microfoundations: theory of the oligopolistic firm 159
4.2.1 Excess capacity and cost functions for industrial firms 160
4.2.2 Prices and profits (markups, margins and shares) 163
4.3 The Kalecki–Steindl macro model 168
4.3.1 Markup pricing, income distribution and capacity utilization 168
4.3.2 Saving–investment equilibrium and the model solution 172
4.3.3 Concentration, stagnation and wage-led growth 176
4.3.4 The paradox of thrift and widow's cruse once again 181
4.4 Alternative neo-Kaleckian models: wage-led versus profit-led demand regimes 181
4.4.1 Positive saving out of wages 182
4.4.2 A more general investment function (the Bhaduri–Marglin model) 185
4.4.3 The open economy neo-Kaleckian model 190
4.5 Conclusions, critiques and extensions 197
Appendix 4.1 The profit share with overhead labour in the short run 205

PART II EXTENDED MODELS OF DISTRIBUTIONAL CONFLICT AND CYCLICAL DYNAMICS

5. Distributional conflict, aggregate demand and neo-Goodwin cycles 209
5.1 Introduction 209
5.2 Conflicting claims models of inflation and distribution 210
5.2.1 A simple model 212
5.2.2 Incorporating productivity growth 215
5.2.3 Linking distribution to demand: the distributive curve 218
5.3 Dynamics of demand and distribution 223
5.3.1 Dynamics with slow adjustment of income distribution 225
5.3.2 Dynamics with similar speeds of adjustment: neo-Goodwin cycles and other cases 229
5.4 Empirical methodologies, findings and critiques 235
5.4.1 Analytical framework and alternative methodologies 235

5.4.2 Major recent studies: results and critiques 240
5.4.3 Problems with aggregative estimates of profit-led demand 244
5.5 Conclusions 250
Appendix 5.1 Conflicting claims and the Phillips curve 257
Appendix 5.2 Stability analysis for neo-Goodwin cycles and other cases 262

6. Neo-Harrodian models and the Harrodian instability debate 264
6.1 Introduction 264
6.2 A review of Harrod's macrodynamics 266
6.3 Neo-Harrodian models 267
6.3.1 Hicksian origins 267
6.3.2 Informal models 268
6.3.3 Ceilings and floors 269
6.3.4 Limit cycles 273
6.3.5 Other contributions 279
6.4 The Harrodian instability debate 281
6.4.1 A generic model 282
6.4.2 Keynesian (in)stability versus Harrodian instability 283
6.4.3 Harrodian instability 287
6.4.4 Classical-Marxian solutions 288
6.4.5 Neo-Kaleckian solutions 292
6.4.6 Other contributions to the debate 298
6.4.7 Empirical controversies 305
6.4.8 A summing up 310
6.5 Conclusions 311
Appendix 6.1 'Taming' Harrodian instability 317

7. New directions: wage inequality, rentier income, financial dynamics and supermultiplier models 318
7.1 Introduction 318
7.2 Models of wage inequality 320
7.2.1 A two-class model with capitalist-managers 321
7.2.2 A three-class model with manager-supervisors 325
7.2.3 The gender wage gap in an export-oriented, semi-industrialized economy 328
7.3 Rentier income and distributional effects in financial models 333
7.3.1 A Kalecki–Steindl model with bondholders 333
7.3.2 A Bhaduri–Marglin model with shareholders 337
7.4 Wolves in sheep's clothing? Models that mimic profit-led dynamics 341

7.4.1 Pseudo-Goodwin cycles produced by financial fragility 341
7.4.2 Consumption-driven, profit-led growth 346
7.5 Supermultiplier models with exogenous components of demand growth 351
7.5.1 The supermultiplier concept 352
7.5.2 Sraffian supermultiplier models 354
7.5.3 Neo-Kaleckian supermultiplier models 362
7.5.4 The turn to exogenous growth theory in heterodox macrodynamics 364
7.6 Conclusions 367
Appendix 7.1 Stability analysis for the Stockhammer–Michell model 373

PART III KALDORIAN APPROACHES: EXPORT-LED GROWTH AND THE BALANCE-OF-PAYMENTS CONSTRAINT

8. Export-led growth and cumulative causation 376
8.1 Introduction 376
8.2 The Kaldorian vision of growth 378
8.2.1 Kaldor's growth laws 378
8.2.2 Structural change and productivity growth 379
8.2.3 Export-driven, demand-led growth 384
8.2.4 A fallacy of composition? 386
8.3 Cumulative causation and the Dixon–Thirlwall model 388
8.3.1 Cumulative causation and the path dependence of the growth process 388
8.3.2 The Dixon–Thirlwall model of export-led growth 390
8.3.3 Income divergence in the Dixon–Thirlwall model 394
8.4 Path dependence in the actual rate of growth 396
8.4.1 A disequilibrium approach to historical contingency 396
8.4.2 A unit root in the growth process 397
8.4.3 Strong path dependence I: technological lock-in and growth 399
8.4.4 Strong path dependence II: institutional change and growth 401
8.5 Reconciling the actual and natural rates of growth 405
8.6 Policy implications 410
8.7 Critiques, evaluations and extensions of the ELCC model 411
8.7.1 Omissions from the model 411

8.7.2 'Too much cumulation, too few contradictions?' 412
8.7.3 The Kaldor paradox and the Beckerman model 413
8.7.4 Cumulative causation and the balance-of-payments constraint 415
8.8 Conclusions 417
Appendix 8.1 Absolute and relative income divergence due to cumulative causation 423
Appendix 8.2 Formal analysis of Figure 8.9 424

9. Balance-of-payments-constrained growth I: Thirlwall's law and extensions 425
9.1 Introduction 425
9.2 Thirlwall's law 427
9.2.1 The basic Thirlwall model 427
9.2.2 Key assumptions of the model 431
9.2.3 A neoclassical solution: comparison and critique 433
9.2.4 Policy implications 436
9.3 Extensions of the model 440
9.3.1 International capital flows 441
9.3.2 Multisectoral models with structural change and intermediate imports 447
9.3.3 A model of two large countries 452
9.4 Partial pass-through and cumulative causation 456
9.4.1 Partial pass-through of exchange rate changes 456
9.4.2 Cumulative causation and Verdoorn's law 459
9.5 Conclusions 461
Appendix 9.1 The Marshall–Lerner condition 468

10. Balance-of-payments-constrained growth II: critiques, alternatives and syntheses 471
10.1 Introduction 471
10.2 Critiques and defences of Thirlwall's law 472
10.2.1 Testing a near-tautology? 473
10.2.2 Foreign income growth and domestic capital accumulation 476
10.2.3 Level versus rates of change in relative prices 477
10.2.4 Country size 478
10.3 Endogeneity of income elasticities 481
10.3.1 Krugman's argument: reversing the causality 481
10.3.2 Heterodox alternatives: relative wages and structural change 485
10.4 Reconciling the BP-equilibrium and natural growth rates 488

10.5 Alternative models of BP constraints for different size countries 493
10.5.1 Razmi's small country model 494
10.5.2 Ros's model of terms-of-trade adjustment in a medium-large country 497
10.6 A grand synthesis? Reconciling ELCC and BPCG 502
10.7 Conclusions 510
Appendix 10.1 Deriving the rate of change in the markup factor 518
