Contents

1. Mathematical Models of Weighted Monte Carlo Methods 1

1.1 Simple Facts from Functional Analysis 1
1.2 Simple Facts from Convergence Theory for Random Functions 6
1.3 Integral Equations of the Transfer Theory and Monte Carlo Methods 8
1.4 Other Integral Equations Solved by Monte Carlo Methods 17
1.5 Monte Carlo Methods for Calculating Integrals 29
1.6 Unbiasedness and Variance of Monte Carlo Methods 33
1.7 Weighted Estimates for Bilinear Functionals 38
1.8 Calculation of the Derivatives of the Linear Functionals and the Weak Convergence of the Functional Estimates 41

2. Using Information About the Solution 47

2.1 Importance Sampling Technique 47
2.2 Weighted Path Estimates in the Transfer Theory 50
2.3 Estimation of the Variance $D\xi_x$ for Importance Sampling Technique 53
2.4 Using the Asymptotic Solution to the One-Velocity Transfer Equation 56

3. Nonlinear Theory of Optimization for Solving Integral Equations 61

3.1 Formulation of the Problem 61
3.2 Investigation of the Master Equation 64
3.3 A Model Problem 68
3.4 Asymptotic Optimization of the Radiative Transfer 69
3.5 Asymptotic Optimization in a Special Class of Densities 73
3.6 Minimization of the Variance of the Collision Estimates 80

4. Minimax Weighted Estimates 87

4.1 Statement of the Problem. The Basic Lemma 87
4.2 The Minimax Estimates for the Integrals 89
4.3 Optimization of Estimates for the Integral Equations 93
4.4 Minimax Choice of the First Step in the Markov Chain 97

5. Vector Monte Carlo Algorithms 99
5.1 Variance Vector Algorithms 99
5.2 Uniform Optimization of Weighted Monte Carlo Estimates in the Transfer Theory 103
5.3 Vector Algorithm Related to a Stratified Sampling with Respect to One Variable 106
5.4 Accuracy of the Monte Carlo Method for Solving the Vector Transfer Equation 112
5.5 Vector Estimates for Triangular Matrix Kernel 116
5.6 Vector Estimates for the Resolvent Iterations 118
5.7 Vector Representations of Bilinear Estimates 122
5.8 Vector Algorithm for Evaluating the Effective Fission Coefficient 125
5.9 Variance Reduction for the Vector Estimates 126
5.10 Asymptotic Investigation of a Monte Carlo Method Combined with the Method of Finite Sums 132

6. Randomization of Weighted Algorithms 137
6.1 Randomized Estimation for Statistical Moments of the Solution 137
6.2 Lower Bound of the Variance. Averaging Exponential Kernels 141
6.3 Special Models of Non-Gaussian Random Fields Related to Stationary Point Fluxes 145
6.4 Simulation of Homogeneous Gaussian Fields by Randomization of the Spectral Representation 152
6.5 Stochastic Problems of Radiative Transfer Theory 156
6.6 A Stochastic Elasticity Problem 160
6.7 Simulation of Admixture Diffusion in Stochastic Velocity Fields 161

7. The Method of Multiple Splitting 165
7.1 Optimization of the Splitting Method 165
7.2 Optimization of the Splitting Technique for Calculating the Transmission Probability 167
7.3 Numerical Calculation of the Optimal Splitting Parameters 169
7.4 Uniform Optimization of the Splitting Method 170
7.5 Randomized Splitting Method 172
7.6 Splitting of the Collision Estimate 172

8. Transformation of Equations and Weighted Estimates 177
8.1 The Averaging Transformation 177
8.2 Translations 180
8.3 Some Relations Between the Variances 185
8.4 Notions on the Functional Convergence of the Estimates 187

9. Monte Carlo Methods and Perturbation Theory 189
9.1 Vector Weighted Monte Carlo Methods 189
9.2 Differentiation of Integral Equations with Respect to a Parameter 191
9.3 Calculation of Perturbations 196
9.4 Calculation of Derivatives 198
9.5 Calculation of Perturbations in the Transfer Theory 200
9.6 Calculation of Derivatives of Solutions to Boundary Value Problems by the Monte Carlo Method 201

Appendix. Models of Random Variables 205
A.1 Simulation of Random Variables 205
A.2 Simulation of Random Vectors 208
