1	Introduction	1
1.1	Process automation and process supervision	1
1.2	Contents	3
1.3	Historical notes	8
<hr/>		
Part I Fundamentals		
2	Supervision and fault management of processes – tasks and terminology	13
2.1	Basic tasks of supervision	13
2.2	Faults, failures, malfunctions	20
2.3	Reliability, availability, safety	21
2.4	Fault tolerance and redundancy	24
2.5	Knowledge-based fault detection and diagnosis	25
2.5.1	Analytic symptom generation	26
2.5.2	Heuristic symptom generation	27
2.5.3	Fault diagnosis	27
2.6	Implementation issues	27
2.7	Problems	29
3	Reliability, Availability and Maintainability (RAM)	31
3.1	Reliability	31
3.1.1	Type of faults	31
3.1.2	Reliability estimation	32
3.1.3	Connected elements	37
3.2	Maintainability	39
3.3	Availability	42
3.4	Fault management for total life cycles	42
3.5	Some failure statistics	42
3.5.1	Statistics of components	43

3.5.2	Statistics of systems	45
3.6	Problems	47
4	Safety, Dependability and System Integrity	49
4.1	Reliability analysis	50
4.2	Event tree analysis (ETA) and fault tree analysis (FTA)	50
4.3	Failure mode and effects analysis (FMEA)	51
4.4	Hazard-analysis (HA)	54
4.5	Risk classification	54
4.6	Integrated reliability and safety design	57
4.7	Problems	57

Part II Fault-Detection Methods

5	Process Models and Fault Modelling	61
5.1	Fault models	63
5.1.1	Basic fault models	63
5.1.2	Examples for fault models	64
5.2	Process models	71
5.2.1	Theoretical and experimental modelling	71
5.2.2	Static process models	73
5.2.3	Linear dynamic process models	74
5.2.4	Nonlinear process models	81
5.3	Problems	82
6	Signal models	83
6.1	Harmonic oscillations	83
6.1.1	Single oscillations	83
6.1.2	Superposition	84
6.1.3	Amplitude modulation	84
6.1.4	Frequency and phase modulation	85
6.1.5	Beating (Libration)	85
6.1.6	Superposition and nonlinear characteristics	88
6.2	Stochastic signals	88
6.2.1	Continuous-time stochastic signals	89
6.2.2	Discrete-time stochastic signals	91
6.3	Problems	93
7	Fault detection with limit checking	95
7.1	Limit checking of absolute values	95
7.2	Trend checking	95
7.3	Change detection with binary thresholds	97
7.3.1	Estimation of mean and variance	97
7.3.2	Statistical tests for change detection	100
7.4	Change detection with fuzzy thresholds	107

7.5	Adaptive thresholds	107
7.6	Plausibility checks	108
7.7	Problems	109
8	Fault detection with signal models	111
8.1	Analysis of periodic signals	111
8.1.1	Bandpass filtering	113
8.1.2	Fourier analysis	113
8.1.3	Correlation Functions	114
8.1.4	Fourier transformation	115
8.1.5	Fast Fourier transformation (FFT)	117
8.1.6	Maximum entropy spectral estimation	122
8.1.7	Cepstrum analysis	127
8.2	Analysis of non-stationary periodic signals	129
8.2.1	Short-time Fourier transform	129
8.2.2	Wavelet transform	129
8.3	Analysis of stochastic signals	131
8.3.1	Correlation analysis	131
8.3.2	Spectrum analysis	133
8.3.3	Signal parameter estimation with ARMA-models	133
8.4	Vibration analysis of machines	134
8.4.1	Vibrations of rotating machines	134
8.4.2	Vibration signal models	135
8.4.3	Vibration analysis methods	139
8.4.4	Speed signal analysis of combustion engines	141
8.5	Problems	146
9	Fault detection with process-identification methods	147
9.1	Identification with correlation functions	149
9.1.1	Estimation of correlation functions	149
9.1.2	Convolution	150
9.2	Parameter estimation for linear processes	151
9.2.1	Method of least squares (LS)	152
9.2.2	Extended least squares (ELS) method	158
9.2.3	Modifications of basic recursive estimators	159
9.2.4	Parameter estimation of time-varying processes	164
9.2.5	Parameter estimation for continuous-time signals	167
9.2.6	Parameter estimation in closed loop	169
9.3	Identification of nonlinear processes	170
9.3.1	Parameter estimation for nonlinear static processes	171
9.3.2	Parameter Estimation with Classical Nonlinear Models	172
9.3.3	Artificial Neural Networks for Identification	173
9.3.4	Identification with Grid-based Look-up Tables for Static Process	188

9.3.5	Parameter Estimation for Non-continuously Differentiable Nonlinear Processes (Friction and Backlash)	190
9.4	Symptom generation with identification models	193
9.5	Problems	195
10	Fault detection with parity equations	197
10.1	Parity eqt ations with transfer functions	197
10.2	Parity equations with state-space models	203
10.2.1	Continuous-time parity approach	203
10.2.2	Discrete-time parity approach	207
10.3	Properties of residuals	210
10.3.1	Generation of enhanced residuals	210
10.3.2	Generation of structured residuals	213
10.3.3	Sensitivity of parity equations	219
10.4	Parity equations for nonlinear processes	220
10.4.1	Parity equations for special nonlinear processes	220
10.4.2	Parity equation for nonlinear, local linear models	221
10.5	Parameter estimation with parity equations	226
10.6	Problems	228
11	Fault detection with state observers and state estimation	231
11.1	State observers	231
11.1.1	Additive faults	232
11.1.2	Multiplicative faults	234
11.1.3	Fault isolation with state observers	234
11.2	State estimation (Kalman filter)	237
11.3	Output observers	243
11.4	Comparison of the parity- and observer-based approaches	246
11.4.1	Comparison of residual equations	246
11.4.2	Comparison by simulations	247
11.5	Problems	252
12	Fault detection of control loops	253
12.1	Effects of faults on the closed loop performance	253
12.2	Signal-based methods for closed-loop supervision	254
12.3	Methods for the detection of oscillations in closed loops	260
12.4	Model-based methods for closed-loop supervision	261
12.5	Problems	265
13	Fault detection with Principal Component Analysis (PCA)	267
13.1	Principal components	267
13.2	Fault detection with PCA	273

14 Comparison and combination of fault-detection methods	279
14.1 Assumptions of model-based fault detection	279
14.2 Suitability of model-based fault-detection methods	282
14.3 Combination of different fault-detection methods	283

Part III Fault-Diagnosis Methods

15 Diagnosis procedures and problems	287
15.1 Introduction to fault diagnosis	287
15.2 Problems of fault diagnosis	289
15.2.1 Diagnosis knowledge representation	290
15.2.2 Prior knowledge	290
15.2.3 Typical statistical symptom distributions	291
15.2.4 Data size	291
15.2.5 Symptom representation	292
15.3 Problems	292
16 Fault diagnosis with classification methods	295
16.1 Simple pattern classification methods	295
16.2 Bayes Classification	296
16.3 Geometric classifiers	299
16.4 Polynomial classification	300
16.5 Decision trees	302
16.6 Neural Networks for fault diagnosis	305
16.6.1 Multi-layer perceptron networks	306
16.6.2 Radial-basis function networks	307
16.6.3 Clustering and self-organizing networks	309
16.7 Problems	310
17 Fault diagnosis with inference methods	311
17.1 Fault trees	312
17.2 Approximate reasoning	317
17.2.1 Forward chaining	318
17.2.2 Backward chaining	322
17.2.3 Summary and comparison	323
17.3 Hybrid neuro-fuzzy systems	324
17.3.1 Structures	324
17.3.2 Identification of membership functions	329
17.3.3 Identification of rules with predefined membership functions	330
17.3.4 Optimization methods	332
17.3.5 Self-learning classification tree (SELECT)	333
17.4 Problems	343

Part IV Fault-Tolerant Systems

18	Fault-tolerant design	347
18.1	Basic redundant structures	347
18.2	Degradation steps	351
18.3	Problems	353
19	Fault-tolerant components and control	355
19.1	Fault-tolerant sensors	355
19.1.1	Hardware sensor redundancy	355
19.1.2	Analytical sensor redundancy	356
19.2	Fault-tolerant actuators	358
19.3	Fault-tolerant communication	359
19.4	Fault-tolerant control systems	360
19.5	Automatic fault-management system	362
19.6	Problems	365

Part V Application Examples

20	Fault detection and diagnosis of DC motor drives	369
20.1	DC motor	369
20.1.1	DC motor test bench	369
20.1.2	Parity equations	371
20.1.3	Parameter estimation	373
20.1.4	Experimental results for fault detection	373
20.1.5	Experimental results for fault diagnosis with SELECT	376
20.2	Electrical throttle valve actuator	382
20.2.1	Actuator setup	382
20.2.2	Parameter estimation	384
20.2.3	Parity equations	387
20.2.4	Diagnostic equipment for quality control	388
21	Fault detection and diagnosis of a centrifugal pump-pipe-system	391
21.1	The pump-pipe-tank system	391
21.2	Mathematical models of the centrifugal pump	392
21.3	Parity equations and parameter estimation	393
22	Fault detection and diagnosis of an automotive suspension and the tire pressures	401
22.1	Mathematical model of a suspension and the test rig	401
22.2	Parameter estimation (test rig)	402
22.3	Parity equations (test rig)	404
22.4	Experimental results with a driving vehicle	405

22.5 Shock absorber fault detection during driving	405
22.6 Tire pressure supervision with spectral analysis	409
23 Appendix	413
23.1 Terminology in fault detection and diagnosis	413
23.2 State variable filtering of noisy signals to obtain signal derivations .	415
23.3 Fuzzy logic – a short introduction	416
23.3.1 Basics	416
23.3.2 Simplification for Fault Diagnosis	420
23.4 Estimation of physical parameters for dynamic processes	420
23.4.1 Introduction	420
23.4.2 On the model structure for processes with lumped parameters	422
23.4.3 Calculation of the physical process coefficients	424
23.4.4 Example: Second order electrical circuit	425
23.5 From Parallel to Hierarchical Rule Structures	426
23.5.1 Parallel Rule Bases	427
23.5.2 Hierarchical Rule Bases	428
References	435
