Table of contents

1 Introduction 1

2 Fundamentals of gas combustion 3

2.1 Regimes of premixed turbulent combustion 3

2.2 Knocking combustion 5

2.2.1 Detection and characterization of knocking 7

2.2.2 Chemistry behind knocking 7

2.2.3 Influence of engine geometry and operation point parameters on knocking 8

2.3 Natural gas as fuel 9

2.3.1 Sources 9

2.3.2 Composition 9

2.3.3 Physical properties 9

2.3.4 Methane Number 10

2.3.5 Emissions from gas combustion 10

2.4 Operation window for large bore natural gas engines 10

2.5 Gas combustion systems 11

2.5.1 Divided combustion chamber (pre-chamber) with external ignition 12

2.5.2 Design features of the pre-chamber 13

2.5.3 Disadvantages of pre-chamber combustion system 15

2.6 Emission legislation for gas engines 15

3 Modeling gas flow, combustion and knocking 17

3.1 3-D CFD modeling of reactive flows 17

3.2 3-D CFD modeling of turbulent flows 19

3.2.1 Modelling laminar burning velocity 21

3.2.2 Modeling turbulent burning velocity 22

3.3 Models for premixed combustion 23

3.3.1 3-D CFD progress variable based models for combustion 23

3.3.2 Combustion models solving reaction chemistry 25

3.4 Models for wall function and wall heat transfer 26
3.5 Models for NO_x formation 26
3.6 Models for auto-ignition in end-gas 27
3.6.1 Knock integral method 28
3.6.2 Using chemical mechanisms in end-gas region 29
3.6.3 Knocking models in 3-D CFD simulation 30

4 Further development of simulation tools 31
4.1 Charge Motion Design process 32
4.2 Modeling gas injection for detailed combustion analysis 33
4.3 Prescribed heat release combustion model 35
4.4 Averaging of heat transfer coefficients 36
4.5 NO_x model 38
4.5.1 Calculation of NO using the extended Zeldovich mechanism 37
4.5.2 Calculation of equilibrium concentrations of combustion products 38
4.5.3 Calculating NO in the CFD solver 39
4.6 Auto-ignition model in unburnt gas 39
4.6.1 Validation of detailed chemistry 40
4.6.2 Calibration of knock integral 42
4.6.3 Implementation in 3-D CFD model and criterion for knock-onset 43

5 Experimental setup 45
5.1 Engine test bench 45
5.2 Operating points 47
5.3 Measurement of component temperatures 48
5.4 Note regarding the measurements 49
5.5 Post processing of measurements 49
5.5.1 Three Pressure Analysis (TPA) Model 49
5.5.2 Calculation of heat release rate in main chamber and pre-chamber 50
5.5.3 Calculation of heat release in pre-chamber 50
5.5.4 Detection and characterization of knocking from experiments 51

5.5.5 Selection of representative cycles 52

6 Validation of simulation models 55

6.1 Validation of TPA Model 55

6.2 Validation of Charge Motion Design (CMD) Process 56

6.2.1 Comparison of pre-chamber variants 56

6.2.2 Variation of air-fuel ratio in the main chamber 58

6.2.3 Extension of CMD process to second engine 60

6.3 Validation of combustion, emission and knock models 61

6.3.1 Gas exchange simulations for the variation of pre-chamber 61

6.3.2 Combustion simulations for the variation of pre-chamber 66

6.3.3 Variation of air-fuel ratio in the main chamber 74

6.3.4 Variation of pre-chamber gas supply pressure 80

6.3.5 Overall validation of the NO_x model 85

6.3.6 Simulation of high knock points 85

6.3.7 Calculation of component temperatures 89

6.4 Summary, further improvements and outlook 93

7 Process for development of new engines 97

7.1 Prediction burn duration for representative percentile cycles 97

7.2 Heat release rate curve fitting to burn duration 99

8 Conclusions 101

9 Appendix 103

9.1 Settings of CFD model for CMD process 103

9.2 Settings of CFD model for detailed fuel injection analysis 104

9.3 Settings of CFD model for combustion 105

9.4 Wall temperatures 105

9.5 Additional data to engine operating points 106

9.6 Mesh effects 107

9.7 Assumptions of standard wall functions 108

9.8 Calculation of gas properties 108

9.9 Calibrated constants of the CMD process 110
9.10 Butterworth Band-pass filter 111
9.11 Correlation of knock onset and intensity 111
9.12 Definition of KP50 and KP85 112
9.13 Calibration of 0-D combustion model 113
9.14 Burn delay in pre-chamber 114
9.15 Simulation of burn delay at spark plug 115
9.16 Knock evaluation at additional points 116
9.17 Vibe curve for modeling combustion 119
9.18 Example of methodology for new engines 120
9.19 Effect of wall temperature assumption on auto-ignition model 122
9.20 Parameterization of PC geometry 125
10 References 127
