

CONTENTS

<i>Chapter 1. Introduction and overview</i>	<i>1</i>
1.1. General background and objectives	1
1.2. On intuitive notions of time and its interrelation with space	1
1.3. Basic concepts of dynamical systems and optimal control	2
1.4. Dynamics and optimality in discrete space: Macro and micro approach	2
1.5. Dynamics and optimality in continuous space	3
1.6. Field description of spatial interactions, a second class of equations of motion, and distributed dynamical systems	3
1.7. Application of the continuous-space frame to location and land-use problems and the evolution of spatial structure	4
1.8. Further applications of the continuous-space frame to classical location, land-use, and transportation problems	5
1.9. The inclusion of capital as a productive factor and of investment processes	5
1.10. Hierarchical theory: Some intuitive concepts and principles, and some formalization	6
1.11. Models of transition processes	6
1.12. General systems concepts and spatial interactions	7
1.13. Speculations on a geometric description of spatial interactions stemming from general relativity theory	7
<i>Chapter 2. Intuitive notions of time and its interrelation with space</i>	<i>9</i>
2.1. Introduction	9
2.2. Models of time	10
2.3. Concomitant use of several models of time: A beginning at a conceptual framework	21
2.4. Space-time as a concept	24
2.5. Concluding remarks	25
<i>Appendix 2. Some speculations relating to intuitive notions of time</i>	<i>27</i>
2.A The notions of a time vector and generalized space-time	27
2.B The notion of effective time	30
2.C Time as derived from distance as a primitive	30

<i>Chapter 3. Basic concepts of dynamical systems and optimal control</i>	33
3.1. Introduction	33
3.2. Some rudimentary notions	34
3.3. A more inclusive concept of a dynamical system	44
3.4. The optimal-control problem	54
<i>Appendix 3. n-Dimensional spaces, variables, relations, and functions</i>	63
3.A Sets and n -dimensional spaces R^n	63
3.B Variables, relations, functions	66
<i>Chapter 4. Dynamics and optimality in discrete space: Macro and micro approach</i>	71
4.1. Introduction	71
4.2. Optimal economic growth of a single-point region: Macro approach	71
4.3. Optimal economic growth of a multiregion system: Macro approach	85
4.4. The multiregion general equilibrium model extended to cover investment	88
4.5. Extension to cover limited government production and distribution	93
4.6. A micro central-planning model with many point regions	98
4.7. Concluding remarks	105
<i>Chapter 5. Dynamics and optimality in continuous space</i>	107
5.1. Introduction	107
5.2. Optimal economic growth in continuous space: A macro approach	107
5.3. Remarks on the transport rate σ and transport investment	118
5.4. A digression on spatial inequalities and social injustice	124
5.5. A micro central-planning model in continuous space	131
5.6. A macro central-planning model and micro behavior	134
5.7. Basic conclusions	140
<i>Appendix 5. Solutions to the simple macro model</i>	141
5.A The nature of solutions to the simple macro model in continuous space	141
5.B Solutions to the simple macro model with time-varying transport rate	147
<i>Chapter 6. Field description of spatial interactions, a second class of equations of motion, and distributed dynamical systems</i>	150
6.1. Introduction	150
6.2. Parallels with models of a moving fluid and of an electric current flowing through a transmission line	151
6.3. Rationale for a two-equation-of-motion model	155
6.4. The macro model with two equations of motion	161

6.5. The inclusion of labor as a basic factor	166
6.6. Incorporation of pollution in the model	172
6.7. Multiregional micro behavior in conjunction with an extended macro central-planning model	175
6.8. A final digression on social injustice	178
6.9. Basic conclusions	181
<i>Appendix 6. Derivation of Euler–Lagrange equations associated with (6.4.1)–(6.4.3) and the meaning of $(x, t) \rightarrow p(x, t)$ and $(x, t) \rightarrow \omega(x, t)$</i>	183
<i>Chapter 7. Application of the continuous-space frame to location and land-use problems and the evolution of spatial structure</i>	186
7.1. Introduction	186
7.2. An agricultural economy	189
7.3. Agriculture and manufacturing in a one-city economy	201
7.4. Agriculture and manufacturing in a three-city economy (one order of node)	210
7.5. Services, manufacturing, and agriculture in a one-city economy	213
7.6. A one-city economy with several agricultural goods: A von Thünen type of framework	216
7.7. Agriculture, manufacturing, services, and agglomeration economies in an economic system of two orders of nodes	219
7.8. Concluding remarks	222
<i>Appendix 7. Some computational results</i>	223
<i>Chapter 8. Further applications of the continuous-space frame to classical location, land-use, and transportation problems</i>	226
8.1. Introduction	226
8.2. Industry based on localized resources (the introduction of a Weberian framework)	227
8.3. Land requirements and the spatial patterns of urban activities	233
8.4. Congestion and land requirements for transportation	239
8.5. Agglomeration and land-use asymmetry	244
8.6. Closing remarks	252
<i>Chapter 9. The inclusion of capital as a productive factor and of investment processes</i>	253
9.1. Introduction	253
9.2. The agricultural–manufacturing one-city model	254

9.3. The inclusion of transition costs	261
9.4. Frameworks embodying plan revision	263
9.5. Concluding remarks	264
<i>Chapter 10. Hierarchical theory: Some intuitive concepts and principles, and some formalization</i>	266
10.1. Introduction	266
10.2. Definitions and comparative-statics analysis regarding hierarchical organization	267
10.3. Dynamical theory: Some beginnings and rudimentary elements	287
10.4. Concluding remarks	309
<i>Chapter 11. Models of transition processes</i>	311
11.1. Introduction	311
11.2. Basic concepts	311
11.3. A model of a social system undergoing transition	316
11.4. A stochastic approach embodying deterministic aspects	326
11.5. Transition processes involving new variables	332
11.6. Spatial diffusion and construction of new space-time patterns	341
11.7. Concluding remarks	344
<i>Chapter 12. General system concepts and spatial interaction</i>	346
12.1. Introduction	346
12.2. The concept of a general system	346
12.3. Interactions, composite systems, decomposition, and decoupling	352
12.4. Hierarchical, multilevel systems	362
12.5. Concluding remarks	371
<i>Appendix 12. A system of N interacting bodies (nations, regions, cities)</i>	372
<i>Chapter 13. Speculations on a geometric description of spatial interactions stemming from general relativity theory</i>	377
13.1. Introduction	377
13.2. A general formulation of the location problem	378
13.3. A line location problem with feedback effects	380
13.4. A parallel mechanical model	387
13.5. A mechanical model with feedbacks and the parallel location problem	391
13.6. Interactions of two bodies (regions, nations, and other bodies)	396
13.7. Gravity-type relativistic effects in continuous-space models	399
13.8. Concluding remarks	401

<i>Contents</i>	xvii
<i>Chapter 14. Overview and prospectus</i>	403
14.1. Overview	403
14.2. Key directions for research	404
<i>Bibliography</i>	410
<i>Author Index</i>	417
<i>Subject Index</i>	419
