Editorial foreword to the second edition	xvii

1. Landslide hazards, risks and disasters: introduction

Tim Davies and Nick Rosser

1.1 Introduction	1
1.2 Understanding landslide hazards	1
1.3 Understanding landslide risks	5
1.4 Understanding future landslide disasters	7
1.5 Conclusion	9
References	10

2. Landslide causes and triggers

Samuel T. McColl

2.1 Introduction	13
2.2 Concept of instability	15
2.3 Stability factors	22
2.3.1 Material strength and topography	22
2.3.2 Strength degradation	25
2.3.3 Groundwater changes	32
2.3.4 Ground shaking	34
2.4 Summary and conclusion	35
References	36

3. Landslides in bedrock

Marc-André Brideau and Nicholas J. Roberts

3.1 Introduction	43
3.2 Rock materials	44
3.2.1 Structural control in strong rock	45
3.2.2 Intact rock strength	48
3.2.3 Rock mass strength	49
3.3 Mass movement characteristics	49
3.3.1 Volume and velocity	49
3.3.2 Landslide displacement activity	50

3.3.3	Progressive failure	51
3.3.4	Runout	53
3.4	Mass movement types	53
3.4.1	Rockfalls	53
3.4.2	Rockslides	54
3.4.3	Rock spreads	55
3.4.4	Rock avalanches	56
3.4.5	Sackungen/deep-seated gravitational slope deformation	57
3.4.6	Complex bedrock mass movements	59
3.4.7	Secondary hazards associated with bedrock landslides	59
3.5	Case studies	61
3.5.1	Seymareh, Iran	61
3.5.2	Mount Meager, Canada	63
3.5.3	La Clapière, France	66
3.5.4	Threatening Rock, United States of America	68
3.6	Bedrock landslide recognition and management	70
3.6.1	Anticipation	70
3.6.2	Avoidance	73
3.6.3	Prevention	74
3.7	Risk management of rock slopes	75
3.8	Summary	77
	References	78

4. Coseismic landslides

Bill Murphy

4.1	Seismically triggered landslides	99
4.1.1	Introduction	99
4.1.2	A note on terminology	100
4.1.3	Landslides caused by earthquakes	102
4.1.4	Geological materials and EILs	108
4.2	Mechanics of earthquake-induced landslides	110
4.2.1	Earthquake energy, magnitude and attenuation	110
4.2.2	Topographic amplification and landslides	113
4.2.3	Shaking and porewater pressures	117
4.2.4	Summary	120
4.3	Stability analysis and hazard assessment	122
4.3.1	Pseudostatic and limit state models	122
4.3.2	The Newmark Sliding block model	124
4.3.3	Coupled analyses	127
4.3.4	Statistical models, hazard mapping and GIS	129
4.4	Limitations of current understanding	132
4.4.1	Seismological unknowns	132
4.4.2	Geotechnical considerations	134
4.4.3	Concluding comments	134
	References	135
	Further reading	138

5. Volcanic debris avalanches

Benjamin van Wyk de Vries and Audray Delcamp

5.1	Introduction	139
5.2	Volcanic debris avalanches	141
5.3	Types of volcanic landslides	143
5.3.1	Large-scale volcano and substrata landslides	143
5.4	Deep-seated volcanic landslide deformation: priming and triggers	145
5.5	Deep-seated volcano gravitational deformation	146
5.6	Regional tectonic influences	146
5.7	Priming of volcanic landslides	148
5.8	Triggering volcanic landslides	148
5.9	The structure of volcanic landslides	149
5.10	Volcanic landslide deposits	149
5.10.1	Scar	152
5.10.2	Toreva blocks	152
5.10.3	Hummocks	152
5.10.4	Inter-hummock areas	153
5.10.5	Ridges	153
5.10.6	Marginal zones	153
5.10.7	Deposit facies	153
5.10.8	Block facies	153
5.10.9	Matrix facies	155
5.10.10	Mixed facies	155
5.10.11	Basal facies	155
5.11	Debris avalanche textures and structures	155
5.12	Secondary hazards of volcanic landslides	156
5.13	Volcanic landslide transport mechanisms	157
5.14	Hazards from volcanic landslides	158
5.15	Summary	159
	References	159

6. Peat landslides

Jeff Warburton

6.1	Introduction and background	165
6.2	The nature of peat, its structure and material properties	167
6.2.1	Peat properties	168
6.2.2	Peat deposits and peat depths	169
6.2.3	'Peat' or 'bog' mass movements?	170
6.3	Morphology and classification of peat landslides	170
6.3.1	A confused terminology	171
6.3.2	A formal classification of peat landslides	172
6.4	Relationship between landslide type and peat stratigraphy	173

6.5	Impacts of peat landslides	176
6.5.1	Example: Cashlaundrumlahan peat flow, Derrybrien, Ireland (October 2003)	179
6.5.2	Example: failure during road construction, North Pennines, UK (August 2006)	181
6.6	The runout of peat landslides	183
6.7	Slope stability analysis of peat landslides and geotechnical properties	185
6.8	Historical perspective on the frequency of peat landslides	187
6.9	The future incidence of peat landslides	191
6.10	Conclusion	193
	References	194

7. Rock–snow–ice avalanches

Rosanna Sosio

7.1	Introduction	199
7.2	Rapid mass movements on glaciers	206
7.2.1	Frequency and distribution	206
7.2.2	Causes	209
7.2.3	Evolution	216
7.3	RSI avalanche propagation	223
7.3.1	Topographic effects	225
7.3.2	Motion on low-friction glaciers	226
7.3.3	Snow and ice content of the granular mass	227
7.3.4	Melting of ice and snow due to frictional heating	228
7.3.5	Snow and ice entrainment	230
7.4	Implications for hazard assessment	230
7.4.1	Probability of occurrence in time	231
7.4.2	Zone of possible initiation	232
7.4.3	Runout prediction	233
7.5	Conclusions	235
	References	237

8. Multiple landslide-damming episodes

Oliver Korup and Gonghui Wang

8.1	Introduction	249
8.2	Previous work on landslide dams	251
8.3	Landslide-dam episodes: lessons from case studies	252
8.3.1	Wenchuan earthquake (M_w 7.9), China, 2008	252
8.3.2	Murchison (Buller) earthquake (M_w 7.8), New Zealand, 1929	259
8.3.3	Typhoon Talas, Japan, 2011	261
8.4	Discussion	263
8.5	Conclusions	266
	Acknowledgements	266
	References	266

9. Rock avalanches onto glaciers

P. Deline, K. Hewitt, D. Shugar and N. Reznichenko

9.1	Introduction	269
9.2	Processes	283
9.2.1	Detachment zone and conditions	283
9.2.2	Supraglacial motion	287
9.2.3	Rock avalanche deposits and sedimentary properties	293
9.3	Consequences	303
9.3.1	Rock avalanche contribution to supraglacial debris covers	303
9.3.2	Glacier dynamics in relation to rock avalanche deposits	304
9.3.3	Atypical moraine complexes and implications for paleo-glacial sequences/reconstruction	310
9.3.4	Post-landslide developments and hazards	311
9.4	Case studies	312
9.4.1	Recent rock avalanches onto glacier in Aoraki/Mount Cook area, New Zealand	313
9.4.2	The 1991 Chillinji Glacier rock avalanche (western Karakoram)	314
9.4.3	Holocene Horcones mass flow, Cerro Aconcagua (6961 m asl), Argentina	318
9.5	Concluding remarks	320
	References	321

10. Paleo-landslides

John J. Clague

10.1	Introduction	335
10.2	Significance of paleo-landslides	336
10.3	Recognition and mapping	337
10.3.1	Role of geomorphology	338
10.3.2	Role of stratigraphy and sedimentology	346
10.4	Dating paleo-landslides	347
10.4.1	Dendrochronology	348
10.4.2	Radiocarbon dating	349
10.4.3	Terrestrial cosmogenic nuclide dating	351
10.5	Temporal bias	352
10.6	Role in landscape evolution	353
10.7	Risk assessment	354
10.7.1	Oso	355
10.7.2	Cheekye Fan	356
10.8	Conclusion	359
	References	360

11. Remote sensing of landslide motion with emphasis on satellite multi-temporal interferometry applications: an overview

J. Wasowski and F. Bovenga

11.1	Introduction	365
11.2	Brief introduction to DInSAR and Multi-Temporal Interferometry	368
11.2.1	DInSAR and MTI	369
11.2.2	Technical and practical aspects of MTI applied to landslide motion detection and monitoring	373
11.3	Examples of different scale MTI applications to landslide motion detection and monitoring	380
11.3.1	Reliability of MTI results	381
11.3.2	Examples of MTI application from the Italian Alps: issues of radar visibility and sensitivity to down-slope movements	382
11.3.3	Examples of MTI application from the Apennine Mountains: instability of hilltop towns	387
11.3.4	Example of MTI application from the mountains of Haiti	396
11.3.5	Example of GBInSAR application from the Southern Apennines, Italy	397
11.4	Summary discussion	401
11.4.1	Landslide motion detection and monitoring using MTI and other remote sensing techniques	408
11.4.2	Underexploited and future MTI application opportunities	410
	Acknowledgements	422
	References	422

12. Small landslides – frequent, costly and manageable

E.T. Bowman

12.1	Introduction	439
12.2	Costs of small–medium landslides	439
12.2.1	Financial and economic losses	439
12.2.2	Social costs	441
12.2.3	Environmental costs	442
12.3	Frequency of landslides	442
12.4	Management of landslides	443
12.4.1	Analysis methods – understanding mechanisms	444
12.4.2	Mitigation methods	446
12.5	Size of manageable landslides	448
12.5.1	Larger managed landslides	449
12.5.2	Larger unmanaged landslides	459
12.5.3	Smaller manageable landslides	461
12.6	Conclusions	470
	References	472

13. Analysis tools for mass movement assessment

Stefano Utili and Giovanni B. Crosta

13.1	Introduction	479
13.2	The computational tools available	480
13.3	Limit equilibrium methods	485
13.3.1	Introduction	485
13.3.2	Assumptions that make the problem determinate	486
13.3.3	Limit equilibrium solutions: physical admissibility and optimal solutions	490
13.3.4	Some critical considerations	493
13.4	Limit analysis	495
13.4.1	The limit analysis upper bound theorem	495
13.5	Continuum numerical methods	496
13.6	Distinct element method	498
13.7	Conclusions	500
	References	500

14. Landslides in a changing climate

Matthias Jakob

14.1	Introduction	505
14.2	Rockfalls, rockslides and rock avalanches	509
14.3	Shallow landslides and debris flows	512
14.3.1	Direct climate change impacts on steep creek processes	512
14.3.2	Indirect climate change effects	516
14.4	Deep-seated landslides in soil	518
14.5	Coastal landslides	521
14.6	Landslides in the cryosphere	524
14.6.1	Changes in periglacial processes	524
14.6.2	Glacial changes	531
14.7	Regional scale landslide response	535
14.8	Landslide risk and economic considerations	536
14.8.1	Landslide risk	536
14.8.2	Economic considerations	543
14.9	Adaptation and mitigation	545
14.10	Summary	547
14.11	Discussion and recommendations	549
14.12	Concluding remarks	562
	Acknowledgements	564
	References	564

15. Rockfall hazard and risk

Nick Rosser and Chris Massey

15.1	Background	581
15.2	Definitions	584

15.3	Case study 1: assessing rockfall hazard, North Yorkshire coast, UK	585
15.3.1	Complete rockfall hazard inventories and magnitude frequency	586
15.3.2	When is most hazardous? Rockfall timing	591
15.4	Vulnerability to rockfall	596
15.4.1	Rockfall hazard intensity	596
15.4.2	Vulnerability of buildings to rockfalls	596
15.4.3	Vulnerability of people to rockfalls	598
15.4.4	Relating vulnerability to rockfall intensity	599
15.5	Case study 2: Port Hills, Christchurch, NZ	600
15.5.1	Damage ratio and damage state	602
15.6	Summary and conclusions	611
	References	613

16. Reducing landslide disaster impacts

Tim Davies

16.1	Introduction	623
16.2	Disaster risk reduction: terminology and implications	625
16.3	Fundamental weakness of DRR	626
16.4	Disaster impacts	628
16.4.1	Nature of impacts	628
16.4.2	Anticipating landslide impacts	629
16.5	Landslide disaster impact reduction	631
16.5.1	Modifying the hazard event(s)	631
16.5.2	Modifying the impacts	632
16.6	Reducing the impacts of the next landslide disaster: a scenario approach	634
16.6.1	Requirements of scenario	635
16.6.2	Selection of impacts scenario	636
16.6.3	Selection of strategy for reducing impacts	636
16.7	Discussion	637
16.8	Conclusions	637
	Acknowledgements	638
	References	638

17. Geomorphic precursors of large landslides: seismic preconditioning and slope-top benches

Tim Davies and Danilo Moretti

17.1	Introduction	641
17.2	Slope-top benches	642
17.3	Mountain edifice response to coseismic shaking	643
17.3.1	Topographic amplification: field evidence	643
17.3.2	Deep-seated failure surfaces	643

17.4	Field evidence	646
17.4.1	Cascade rock avalanche, New Zealand	646
17.4.2	Round Top rock avalanche	648
17.4.3	Roche Pass slope failure	648
17.4.4	Toppenish Ridge failure and rock avalanche	649
17.4.5	Shimizu landslide	651
17.4.6	Turiwhate	652
17.4.7	Kelly Range	652
17.5	Example of possible hazard: slope overlooking Franz Josef glacier township	654
17.5.1	Hillslope	654
17.5.2	Implications	658
17.5.3	Consequences	659
17.5.4	Failure probability	660
17.5.5	Risk to life	661
17.5.6	Risk management	661
17.6	Discussion	662
17.7	Conclusions	663
	Acknowledgements	664
	References	664
	Further reading	666
	Index	667
