PREFACE	<i>page</i> xiii
1 EARLY ATOMIC THEORY	1
1.1 Gas Properties	2
Air pressure <input type="checkbox"/> Boyle's law <input type="checkbox"/> Temperature Scales <input type="checkbox"/> Charles' law <input type="checkbox"/> Explanation of gas laws <input type="checkbox"/> Ideal gas law	
1.2 Chemistry	6
Elements <input type="checkbox"/> Law of combining weights <input type="checkbox"/> Dalton's atomic weights <input type="checkbox"/> Law of combining volumes <input type="checkbox"/> Avogadro's principle <input type="checkbox"/> The gas constant <input type="checkbox"/> Avogadro's number	
1.3 Electrolysis	10
Early electricity <input type="checkbox"/> Early magnetism <input type="checkbox"/> Electromagnetism <input type="checkbox"/> Discovery of electrolysis <input type="checkbox"/> Faraday's theory <input type="checkbox"/> The faraday	
1.4 The Electron	14
Cathode rays <input type="checkbox"/> Thomson's experiments <input type="checkbox"/> Electrons as atomic constituents	
2 THERMODYNAMICS AND KINETIC THEORY	16
2.1 Heat and Energy	16
Caloric <input type="checkbox"/> Heat as energy <input type="checkbox"/> Kinetic energy <input type="checkbox"/> Specific heat <input type="checkbox"/> Energy density and pressure <input type="checkbox"/> Adiabatic changes	

2.2 Absolute Temperature	21
Carnot cycles <input type="checkbox"/> Theorems on efficiency <input type="checkbox"/> Absolute temperature defined	
<input type="checkbox"/> Relation to gas thermometers	
2.3 Entropy	27
Definition of entropy <input type="checkbox"/> Independence of path <input type="checkbox"/> Increase of entropy	
<input type="checkbox"/> Thermodynamic relations <input type="checkbox"/> Entropy of ideal gases <input type="checkbox"/> Neutral matter	
<input type="checkbox"/> Radiation energy <input type="checkbox"/> Laws of thermodynamics	
2.4 Kinetic Theory and Statistical Mechanics	33
Maxwell–Boltzmann distribution <input type="checkbox"/> General H -theorem <input type="checkbox"/> Time reversal	
<input type="checkbox"/> Canonical and grand-canonical distributions <input type="checkbox"/> Connection with thermodynamics	
<input type="checkbox"/> Compound systems <input type="checkbox"/> Probability distribution in gases <input type="checkbox"/> Equipartition of energy <input type="checkbox"/> Entropy as disorder	
2.5 Transport Phenomena	42
Conservation laws <input type="checkbox"/> Galilean relativity <input type="checkbox"/> Navier–Stokes equation <input type="checkbox"/> Viscosity	
<input type="checkbox"/> Mean free path <input type="checkbox"/> Diffusion	
2.6 The Atomic Scale	53
Nineteenth century estimates <input type="checkbox"/> Electronic charge <input type="checkbox"/> Brownian motion	
<input type="checkbox"/> Consistency of constants <input type="checkbox"/> Appendix: Einstein’s diffusion constant rederived	
3 EARLY QUANTUM THEORY	61
3.1 Black Body Radiation	61
Absorption and energy density <input type="checkbox"/> Degrees of freedom of electromagnetic fields	
<input type="checkbox"/> Rayleigh–Jeans distribution <input type="checkbox"/> Planck distribution <input type="checkbox"/> Measurement of Boltzmann constant <input type="checkbox"/> Radiation energy constant	
3.2 Photons	67
Quantization of radiation energy <input type="checkbox"/> Derivation of Planck distribution	
<input type="checkbox"/> Photoelectric effect <input type="checkbox"/> Particles of light	
3.3 The Nuclear Atom	71
Radioactivity <input type="checkbox"/> Alpha and beta rays <input type="checkbox"/> Discovery of the nucleus <input type="checkbox"/> Nuclear mass	
<input type="checkbox"/> Nuclear size <input type="checkbox"/> Scattering pattern <input type="checkbox"/> Nuclear charge	
3.4 Atomic Energy Levels	77
Spectral lines <input type="checkbox"/> Electron orbits <input type="checkbox"/> Combination principle <input type="checkbox"/> Bohr’s quantization condition <input type="checkbox"/> Correspondence principle <input type="checkbox"/> Comparison with observed one-electron atomic spectra <input type="checkbox"/> Reduced mass <input type="checkbox"/> Atomic number <input type="checkbox"/> Outstanding questions	

3.5 Emission and Absorption of Radiation	84
Einstein A and B coefficients <input type="checkbox"/> Equilibrium with black body radiation <input type="checkbox"/> Relations among coefficients <input type="checkbox"/> Lasers <input type="checkbox"/> Suppressed absorption	
4 RELATIVITY	88
4.1 Early Relativity	88
Motion of the Earth <input type="checkbox"/> Relativity of motion <input type="checkbox"/> Speed of light <input type="checkbox"/> Michelson–Morley experiment <input type="checkbox"/> Lorentz–Fitzgerald contraction	
4.2 Einsteinian Relativity	94
Postulate of invariance of electrodynamics <input type="checkbox"/> Lorentz transformations <input type="checkbox"/> Space inversion, time reversal <input type="checkbox"/> The Galilean limit <input type="checkbox"/> Maximum speed <input type="checkbox"/> Boosts in general directions <input type="checkbox"/> Special and general relativity	
4.3 Clocks, Rulers, Light Waves	103
Clocks and time dilation <input type="checkbox"/> Rulers and length contraction <input type="checkbox"/> Transformation of frequency and wave number	
4.4 Mass, Energy, Momentum, Force	106
Einstein's thought experiment <input type="checkbox"/> Formulas for energy and momentum <input type="checkbox"/> $E = mc^2$ <input type="checkbox"/> Force in relativistic dynamics	
4.5 Photons as Particles	111
Photon momentum <input type="checkbox"/> Compton scattering <input type="checkbox"/> Other massless particles	
4.6 Maxwell's Equations	114
The inhomogeneous and homogeneous equations <input type="checkbox"/> Density and current of electric charge <input type="checkbox"/> Relativistic formulation of inhomogeneous Maxwell equations <input type="checkbox"/> Indices upstairs and downstairs <input type="checkbox"/> Relativistic formulation of homogeneous Maxwell equations <input type="checkbox"/> Electric and magnetic forces	
4.7 Causality	121
Causes precede effects <input type="checkbox"/> Invariance of temporal order <input type="checkbox"/> Maximum signal speed <input type="checkbox"/> Light cone	
5 QUANTUM MECHANICS	124
5.1 De Broglie Waves	125
Free-particle wave functions <input type="checkbox"/> Group velocity <input type="checkbox"/> Application to hydrogen <input type="checkbox"/> Davisson–Germer experiment <input type="checkbox"/> Electron microscopes <input type="checkbox"/> Appendix: Derivation of the Bragg formula	

5.2 The Schrödinger Equation	129
Wave equation for particle in potential <input type="checkbox"/> Boundary conditions <input type="checkbox"/> Spherical symmetry <input type="checkbox"/> Radial and angular wave functions <input type="checkbox"/> Angular multiplicity <input type="checkbox"/> Spherical harmonics <input type="checkbox"/> Hydrogenic energy levels <input type="checkbox"/> Degeneracy	
5.3 General Principles of Quantum Mechanics	138
States and wave functions <input type="checkbox"/> Observables and operators <input type="checkbox"/> Hamiltonian <input type="checkbox"/> Adjoints <input type="checkbox"/> Expectation values <input type="checkbox"/> Probabilities <input type="checkbox"/> Continuum limit <input type="checkbox"/> Momentum space <input type="checkbox"/> Commutation relations <input type="checkbox"/> Uncertainty principle <input type="checkbox"/> Time dependent wave functions <input type="checkbox"/> Conservation laws <input type="checkbox"/> Heisenberg and Schrödinger pictures	
5.4 Spin and Orbital Angular Momentum	151
Doubling of sodium D-line <input type="checkbox"/> The idea of spin <input type="checkbox"/> General action of rotations on wave functions <input type="checkbox"/> Total angular momentum operator <input type="checkbox"/> Commutation relations <input type="checkbox"/> Spin and orbital angular momentum <input type="checkbox"/> Multiplets <input type="checkbox"/> Adding angular momenta <input type="checkbox"/> Atomic fine structure and space inversion <input type="checkbox"/> Hyperfine structure <input type="checkbox"/> Appendix: Clebsch–Gordan Coefficients	
5.5 Bosons and Fermions	165
Identical particles <input type="checkbox"/> Symmetric and antisymmetric wave functions <input type="checkbox"/> Bosons and fermions in statistical mechanics <input type="checkbox"/> Hartree approximation <input type="checkbox"/> Slater determinant <input type="checkbox"/> Pauli exclusion principle <input type="checkbox"/> Periodic table of elements <input type="checkbox"/> Diatomic molecules: para and ortho <input type="checkbox"/> Astrophysical cooling	
5.6 Scattering	175
Scattering wave function <input type="checkbox"/> Representations of the delta function <input type="checkbox"/> Calculation of the Green's function <input type="checkbox"/> Scattering amplitude <input type="checkbox"/> Probabilistic interpretation <input type="checkbox"/> Cross section <input type="checkbox"/> Born approximation <input type="checkbox"/> Scattering by shielded Coulomb potential <input type="checkbox"/> Appendix: General transition rates	
5.7 Canonical Formalism	190
Hamiltonian formalism <input type="checkbox"/> Canonical commutation relations <input type="checkbox"/> Lagrangian formalism <input type="checkbox"/> Action principle <input type="checkbox"/> Connection of formalisms <input type="checkbox"/> Noether's theorem: symmetries and conservation laws <input type="checkbox"/> Space translation and momentum	
5.8 Charged Particles in Electromagnetic Fields	195
Vector and scalar potential <input type="checkbox"/> Charged particle Hamiltonian <input type="checkbox"/> Equations of motion <input type="checkbox"/> Gauge transformations <input type="checkbox"/> Magnetic interactions <input type="checkbox"/> Spin coupling	
5.9 Perturbation Theory	199
Perturbative expansion <input type="checkbox"/> First-order perturbation theory <input type="checkbox"/> Dealing with degeneracy <input type="checkbox"/> The Zeeman effect <input type="checkbox"/> Second-order perturbation theory	

5.10 Beyond Wave Mechanics	206
State vectors <input type="checkbox"/> Linear operators <input type="checkbox"/> First postulate: values of observables <input type="checkbox"/> Second postulate: expectation values <input type="checkbox"/> Probabilities <input type="checkbox"/> Continuum limit <input type="checkbox"/> Wave functions as vector components	
6 NUCLEAR PHYSICS	210
6.1 Protons and Neutrons	210
Discovery of the proton <input type="checkbox"/> Integer atomic weights <input type="checkbox"/> Nuclei as protons and electrons? <input type="checkbox"/> Trouble with diatomic nitrogen <input type="checkbox"/> Discovery of the neutron <input type="checkbox"/> Nuclear radius and binding energy <input type="checkbox"/> Liquid drop model <input type="checkbox"/> Stable valley and decay modes	
6.2 Isotopic Spin Symmetry	216
Neutron–proton and proton–proton forces <input type="checkbox"/> Isotopic spin rotations <input type="checkbox"/> Isotopic spin multiplets <input type="checkbox"/> Quark model <input type="checkbox"/> Pions <input type="checkbox"/> Appendix: The three–three resonance	
6.3 Shell Structure	224
Harmonic oscillator approximation <input type="checkbox"/> Raising and lowering operators <input type="checkbox"/> Degenerate multiplets <input type="checkbox"/> Magic numbers <input type="checkbox"/> Spin–orbit coupling	
6.4 Alpha Decay	229
Coulomb barrier <input type="checkbox"/> Barrier suppression factors <input type="checkbox"/> Semi-classical estimate of alpha decay rate <input type="checkbox"/> Level splitting <input type="checkbox"/> Geiger–Nuttall law <input type="checkbox"/> Radium alpha decay <input type="checkbox"/> Appendix: Quantum theory of barrier penetration rates	
6.5 Beta Decay	243
Electron energy distribution <input type="checkbox"/> Neutrinos proposed <input type="checkbox"/> Fermi theory <input type="checkbox"/> Gamow–Teller modification <input type="checkbox"/> Selection rules <input type="checkbox"/> Strength of weak interactions <input type="checkbox"/> Neutrinos discovered <input type="checkbox"/> Violation of left–right and matter–antimatter symmetries <input type="checkbox"/> Neutrino helicities <input type="checkbox"/> Varieties of neutrino	
7 QUANTUM FIELD THEORY	251
7.1 Canonical Formalism for Fields	252
Action, Lagrangian, Lagrangian density <input type="checkbox"/> Functional derivatives <input type="checkbox"/> Euler–Lagrange field equations <input type="checkbox"/> Commutation relations <input type="checkbox"/> Energy and momentum of fields	
7.2 Free Real Scalar Field	255
Lagrangian density <input type="checkbox"/> Field equation <input type="checkbox"/> Creation and annihilation operators <input type="checkbox"/> Energy and momentum <input type="checkbox"/> Vacuum state <input type="checkbox"/> Multiparticle states	

7.3 Interactions	261
Time-ordered perturbation theory <input type="checkbox"/> Requirements for Lorentz invariance <input type="checkbox"/> Example: Scattering of neutral spinless particles <input type="checkbox"/> Feynman diagram <input type="checkbox"/> Calculation of the propagator <input type="checkbox"/> Yukawa potential	
7.4 Antiparticles, Spin, Statistics	270
Antiparticles needed <input type="checkbox"/> Complex scalar field <input type="checkbox"/> General fields <input type="checkbox"/> Lorentz transformation <input type="checkbox"/> Spin–statistics connection <input type="checkbox"/> Appendix: Dirac fields	
7.5 Quantum Theory of Electromagnetism	280
Lagrangian density for electrodynamics <input type="checkbox"/> Four-vector potential <input type="checkbox"/> Gauge transformations <input type="checkbox"/> Coulomb gauge <input type="checkbox"/> Commutation relations <input type="checkbox"/> Free fields <input type="checkbox"/> Photon momentum and helicity <input type="checkbox"/> Radiative decay rates <input type="checkbox"/> Selection rules <input type="checkbox"/> Gauge invariance and charge conservation <input type="checkbox"/> Local phase invariance <input type="checkbox"/> Standard model
