Introduction	7	4.3 Motor control and limiting influences on force production	132
1 The basic concepts of strength and speed	13	4.4 The laws of motor learning and training	140
1.1 Reductionism versus complex biological systems	13	4.5 Summary	178
1.2 Strength training characteristics required for effective transfer to athletic movement	26	5 Specificity within strength training	181
1.3 Tradition of sport-specific strength training resulting from the reductionist approach	33	5.1 Specificity and transfer of training	181
1.4 Sport-specific strength training and motor control	54	5.2 Limited transfer of strength and power	182
1.5 Summary	59	5.3 Categories of specificity	190
2 Anatomy and limiting influences on force production	61	5.4 Barbells versus strength machines	203
2.1 Influences at muscle level	61	5.5 Limitations on specificity of strength training	204
2.2 Neuromuscular transition	82	5.6 An example: hamstring action and specificity	210
2.3 Circuits at spinal-cord level	86	5.7 Summary	225
2.4 Central influences	95	6 Overload within strength training	227
2.5 Summary	97	6.1 Overload	227
3 Analysing the sporting movement	99	6.2 Force production in the sporting movement and overload within strength training	234
3.1 Open and closed skills	99	6.3 Newton's laws or the laws of motor learning?	241
3.2 Attractors and fluctuators within movement patterns	100	6.4 The law of variability as a guideline	244
3.3 Summary	122	6.5 Summary	263
4 Fixed principles of training: contextual strength and coordination	123	7 Sport-specific strength training in practice	265
4.1 Physiological or coordinative adaptations in strength?	123	7.1 Body-part and contextual approaches to strength training	265
4.2 Adaptations in strength: the physiological approach	127		

7.2	Division of strength training based on the adaptations that occur	273	Bibliography	325
7.3	Exercises approached in terms of coordination	284	Acknowledgements	335
7.4	Summary	322	Index	337
