

Preface	xi
0 Introduction	1
0.1 Background	1
0.2 Perspective	4
0.3 Tools	7
0.4 What is a communication?	8
I A FOUNDATION COURSE IN CSP	11
1 Fundamental concepts	13
1.1 Fundamental operators	14
1.2 Algebra	29
1.3 The traces model and traces refinement	35
1.4 Tools	48
2 Parallel operators	51
2.1 Synchronous parallel	51
2.2 Alphabetized parallel	55
2.3 Interleaving	65
2.4 Generalized parallel	68

2.5	Parallel composition as conjunction	70
2.6	Tools	74
2.7	Postscript: On alphabets	76
3	Hiding and renaming	77
3.1	Hiding	77
3.2	Renaming and alphabet transformations	86
3.3	A basic guide to failures and divergences	92
3.4	Tools	98
4	Piping and enslavement	99
4.1	Piping	99
4.2	Enslavement	105
4.3	Tools	109
5	Buffers and communication	113
5.1	Pipes and buffers	113
5.2	Buffer tolerance	125
5.3	The alternating bit protocol	128
5.4	Tools	133
6	Termination and sequential composition	135
6.1	What is termination?	135
6.2	Distributed termination	139
6.3	Laws	140
6.4	Effects on the traces model	143
6.5	Effects on the failures/divergences model	144
II	THEORY	147
7	Operational semantics	149
7.1	A survey of semantic approaches to CSP	149
7.2	Transition systems and state machines	151
7.3	Firing rules for CSP	158

7.4	Relationships with abstract models	170
7.5	Tools	177
7.6	Notes	178
8	Denotational semantics	179
8.1	Introduction	179
8.2	The traces model	182
8.3	The failures/divergences model	191
8.4	The stable failures model	207
8.5	Notes	214
9	Analyzing the denotational models	217
9.1	Deterministic processes	217
9.2	Analyzing fixed points	223
9.3	Full abstraction	228
9.4	Relations with operational semantics	238
9.5	Notes	243
10	Infinite traces	245
10.1	Calculating infinite traces	245
10.2	Adding failures	251
10.3	Using infinite traces	258
10.4	Notes	267
11	Algebraic semantics	269
11.1	Introduction	269
11.2	Operational semantics via algebra	271
11.3	The laws of $\perp_{\mathcal{N}}$	275
11.4	Normalizing	277
11.5	Sequential composition and <i>SKIP</i>	286
11.6	Other models	290
11.7	Notes	292

12 Abstraction	295
12.1 Modes of abstraction	296
12.2 Reducing specifications	306
12.3 Abstracting errors: specifying fault tolerance	309
12.4 Independence and security	316
12.5 Tools	325
12.6 Notes	326
III PRACTICE	329
13 Deadlock!	331
13.1 Basic principles and tree networks	331
13.2 Specific ways to avoid deadlock	343
13.3 Variants	358
13.4 Network decomposition	370
13.5 The limitations of local analysis	373
13.6 Deadlock and tools	375
13.7 Notes	380
14 Modelling discrete time	383
14.1 Introduction	383
14.2 Meeting timing constraints	384
14.3 Case study 1: level crossing gate	388
14.4 Checking untimed properties of timed processes	398
14.5 Case study 2: the alternating bit protocol	403
14.6 Urgency and priority	409
14.7 Tools	412
14.8 Notes	413
15 Case studies	415
15.1 Combinatorial systems: rules and tactics	416
15.2 Distributed data and data-independence	422
15.3 Breaking crypto-protocols	446
15.4 Notes	464

A	Mathematical background	467
A.1	Partial orders	467
A.2	Metric spaces	486
B	A guide to machine-readable CSP	495
B.1	Introduction	495
B.2	Expressions	496
B.3	Pattern matching	502
B.4	Types	504
B.5	Processes	508
B.6	Special definitions	511
B.7	Mechanics	514
B.8	Missing features	515
B.9	Availability	515
C	The operation of FDR	517
C.1	Basic operation	517
C.2	Hierarchical compression	528
	Notation	539
	Bibliography	543
	Main index	551
	Index of named processes	563
