CONTENTS

INTRODUCTION TO THE SERIES v

PREFACE vii

PART I. INTRODUCTION

Chapter 1. Comments on the subject *3*

1.1. The purpose of the study 3
1.2. Basic assumptions adopted 4
1.3. A brief survey of problems 11

PART II. WEBER-MODELS

Chapter 2. Cost of transportation as a function of the location of a single factory *19*

2.1. The pattern of deliveries in a one-dimensional market 19
2.2. Trade partners are given *a priori* 23
2.3. Trade partners are not given *a priori* 26
2.4. Substitution possibilities in production and non-linear transport cost functions 29
2.5. Variation of the cost of transportation when one factory is moved out of an agglomeration 31

Chapter 3. Procedures to determine whether an agglomeration is too large *35*

3.1. Introduction 35
3.2. Variation of the cost of transportation when several factories are moved out of an agglomeration. Simple case 36
3.3. The optimal pattern of location in the simple case 44
3.4. Minimization of the cost of transportation in a more general case . . . 48
3.5. Methods for deciding whether a centre should be divided 52

Chapter 4. Growth of agglomerations. A single decision at each point of time *58*

4.1. The basic model 58
4.2. First alternative. Short-run optimization 60
4.3. First alternative. Comparison of results of long-run and short-run optimization 63
4.4. First alternative. Long-run losses by a short-sighted location policy . . . 64
4.5. Second alternative 68

Chapter 5. Growth of agglomerations. Decentralized decisions 71

5.1. The decision problem of a single factory 71
5.2. A comparison with other growth models 76
5.3. Other patterns of non-optimal growth of agglomerations 79

PART III. PROGRAMMING MODELS

Chapter 6. Costs as functions of the production volumes of factories 87

6.1. Variation of costs if production is transferred between two factories . . . 87
6.2. Conditions for constrained maxima 92
6.3. Minimization of the cost of transportation – several products 96
6.4. Minimization of total cost – one product 103

Chapter 7. Implementation of an optimal solution 105

7.1. Decentralization and Lagrange-functions 105
7.2. Constant marginal input-coefficients and fixed costs 111
7.3. A system of incentives suggested by Arrow and Hurwicz 117
7.4. A third alternative Lagrange-function 121
7.5. The system of adjustments 127

PART IV. LÖSCH-MODELS

Chapter 8. Simple patterns of location which are locally optimal with respect to production volumes and locations 135

8.1. Introduction 135
8.2. The set of Lösch-patterns 136
8.3. Statement of the second-order conditions. 139
8.4. Variations of locations either of factories or of markets 141
8.5. Variations of locations both of factories and of markets 145

Appendix to Chapter 8 147

Chapter 9. The optimal size of factories 155

9.1. Introduction 151
9.2. A simple special case 152
9.3. A general case 156
9.4. An implementation procedure 164
9.5. Determination of subsidies by means of observed cost of transportation . . 166
9.6. Estimation of properties of cost functions 174
9.7. Size of factories in different parts of a market 177

PART V. AN ATTEMPT TO INVESTIGATE WHETHER THERE SHOULD BE ONLY ONE CENTRE

Chapter 10. Determination of the production structure at a location 187

10.1. Locally balanced and nationally balanced industries 187
10.2. Notation and assumptions 188
10.3. The demand structure at a location. Local multipliers 191

10.4. Construction of input-output table for hypothetical economy 192
10.5. The treatment of the transport sector 196
10.6. Comments on the tables 197

Chapter 11. Effects on the cost of transportation of dividing a main centre 206

11.1. Introduction 206
11.2. Effects of aggregation 207
11.3. Estimation of transport rates 210
11.4. Effects on the cost of transportation of moving factories out of a main centre 215

Chapter 12. Concluding remarks 220
