Glossary of symbols xxvii

Chapter 1. Introduction 1

1.1 An historic perspective on the estimation of electric power supply costs 2

1.2 Some recent events and their implications for cost information needs in the regulatory process 4

1.3 Plan of the book 7

Chapter 2. Optimal resource allocation for electric power supply 9

2.1 Introduction 9

2.2 Some background for optimal resource allocation in electric power supply 9

2.3 Physical environmental quality considerations in electric power pricing 14

2.3.1 Failure of the market to reflect externalities 14

2.3.2 Correcting market failure: how much pollution? 16

2.3.3 The role of electric power regulatory agencies in amending pollution-related market failure 24

2.4 Historical perspective on rate structure theory 26

2.4.1 Differentiation among classes 27

2.4.2 Differentiation within classes 29

2.4.3 Differentiation due to decreasing costs over time 30

2.4.4 Differentiation due to static decreasing average costs 31

2.5 A direct approach to peak load pricing 32

2.5.1 Some preliminaries 32

2.5.2 The conventional theory of peak load pricing: peak users bear all capacity charges 33

2.5.3 Some revisions of the Steiner result 36
2.5.4 Time-of-day pricing and inter-class discrimination 36
2.5.5 Why time-of-day pricing allocates resources "efficiently" 37
2.5.6 Some additional considerations in the theory of peak load pricing 37
2.6 Optimal departures from marginal cost pricing 38
2.6.1 The basic inverse-elasticity rule for optimal departures from marginal cost pricing 39
2.6.2 Optimal departure with "rate of return on investment" profit constraint 42
2.6.3 Optimal departure with the basic model and demand interdependence 44
2.6.4 Summary of optimal departure results 45
2.7 Concluding remarks on optimal resource allocation for electric power supply 46

Chapter 3. Technology and costs of electric power supply 49

3.1 Conventional electric power system technology 49
3.1.1 Generation 49
3.1.2 Transmission 51
3.1.3 Distribution 51
3.1.4 Time variation of demand 51
3.1.5 Reserves 52
3.2 The firm's costs 53
3.2.1 Power system cost breakout 54
3.2.2 Costs and factor adjustment over time: static versus dynamic analytical frameworks 54
3.2.3 Defining system marginal and average costs 56
3.2.4 Comparing capital (capacity) and operating cost on an equivalent annual basis 58
3.2.5 Comparing costs of new and existing equipment: the plant retirement question 60
3.3 Review of previous cost studies in the electric power industry 63

Chapter 4. A mathematical programming model for static long-run costs of a thermal-electric power supply system 67

4.1 Review of pertinent models of electric power system costs 67

4.1.1 Production cost models 68
4.1.2 Capacity expansion simulation models 69
4.1.3 Capacity expansion mathematical programming models 70
4.1.4 Pollution emission constrained models 73
4.2 General outline of the model 74
4.3 Time variation of demand 76
4.4 Transmission 78
4.4.1 The continuity constraint 78
4.4.2 Losses 79
4.4.3 Bi-directional transmission 80
4.4.4 Costs 81
4.5 Generation 84
4.5.1 Factor substitution in electric power generation 84
4.5.2 New steam turbine–generator plant variables 86
4.5.3 Gas turbines 87
4.5.4 Existing plants 88
4.5.5 Pumped storage 89
4.6 Reserves 90
4.6.1 The basic reserves equations 90
4.6.2 Reserves needs when other types of plants are included 91
4.6.3 Reserves to cover losses 92
4.6.4 Reserves for shared plants 92
4.7 Dual variables and the system cost of a marginal unit of demand 92
4.7.1 On the interpretation of dual variables in mixed-integer mathematical programs 93
4.7.2 The dual variable for peak period demand 95
4.8 Multi-season models 96
4.9 Pollution emission constraints and abatement costs 97
4.10 Some computational notes 99
4.10.1 Computing optimal solutions 99
4.10.2 Delineating system cost curves 99
4.10.3 Accounting cost constraints 100
4.11 Summary of the model 101

Chapter 5. Application to the New York State Electric and Gas Corporation system 103

5.1 Generation 104
5.1.1 The system "control area" 104
5.1.2 Existing plants 105

5.1.3 New plants 106
5.2 Transmission 106
5.2.1 System layout 106
5.2.2 System density 108
5.2.3 Power interchanges 108
5.3 Loads 109
5.3.1 Geographic distribution 109
5.3.2 Time distribution 109
5.3.3 Load center load factors 115
5.4 Static expansion of demand 116
5.5 Pollution emissions considered in this study 116
5.6 Defining the nature of the emission standard 116
5.6.1 Thermal emissions 117
5.6.2 Air pollution emissions 117
5.7 Abatement cost functions 117
5.8 Selection of emission standards 118
5.8.1 Set I emission standards 119
5.8.2 Sets II and III emission standards 119
5.8.3 Set IV emission standards 122
5.8.4 Trend in the standards 123
5.9 Emissions not considered in this study 124
5.9.1 Radio-active wastes 124
5.9.2 Oxides of nitrogen 125

Chapter 6. Cost functions and technical coefficients 127

6.1 New coal-fired steam plants 127
6.1.1 Capital costs 127
6.1.2 Operating costs 145
6.2 New nuclear-fueled steam plants 148
6.2.1 Capital costs 148
6.2.2 Operating costs 150
6.3 Existing steam plants 153
6.3.1 Cost considerations 153
6.3.2 Cost of existing air pollution controls 155
6.4 Gas turbines 156
6.4.1 Principles 156
6.4.2 Capital costs 156
6.4.3 Operating costs 157
6.5 Pumped storage 159
6.5.1 Principles of operation 159
6.5.2 Application to the Blenheim–Gilboa plant 159

6.5.3 Capital costs 160
6.5.4 Operating costs 162
6.6 Air pollution abatement technology and costs 162
6.6.1 Fly-ash abatement 163
6.6.2 SO_2 abatement 168
6.6.3 Cost of meeting fly-ash and SO_2 standards 172
6.6.4 Abatement of oxides of nitrogen 179
6.7 Heat dissipation technology and cost coefficients 181
6.7.1 "Once-through" rejection of heat 181
6.7.2 Heat dissipation to the atmosphere 182
6.7.3 Determination of evaporative cooling tower costs 184
6.7.4 Thermal effluent diffusion models and diffusion costs 193
6.8 Transmission costs 207
6.9 Transmission losses 212

Chapter 7. Results 217

7.1 Introduction 217
7.2 System average operating costs, capital costs and total costs subject to emission standards 219
7.2.1 System costs with set I emission standards and nuclear-fueled new steam plants 220
7.2.2 System costs with set I emission standards and coal-fired new steam plants 228
7.2.3 A note on model bias 233
7.2.4 System costs with sets II and III emission standards and nuclear-fueled and coal-fired new steam plants 234
7.2.5 System costs with set IV emission standards 243
7.2.6 Summary of plot nos. 1–8 251
7.2.7 Sensitivity of system costs to plant capital costs 253
7.2.8 Sensitivity of system costs to fuel costs 256
7.3 Time- and space-specific marginal costs for 62.4% annual system Load Factor 258
7.3.1 Time-specific marginal costs for sets I–IV emission standards when new steam plants are nuclear-fueled 258
7.3.2 Time-specific marginal costs for sets I–IV emission standards when new steam plants are coal-fired 263

7.3.3 Time- and space-specific marginal costs for all load centers 263
7.3.4 Time-specific marginal costs for a different load duration 267
7.3.5 Implications of these results for a time-of-day pricing policy 270
7.4 Effect of Load Factor on system costs 273
7.4.1 Changing load uniformity (Load Factor) 274
7.4.2 Results when Load Factor varies 276
7.4.3 Relative benefits and costs of time-specific pricing 280
7.5 Some observations on pumped storage and system costs 287
7.5.1 Performance of the pumped storage facility 288
7.5.2 System costs when pumped storage is not available 293
7.5.3 Effect of Load Factor on pumped storage activity 296

Chapter 8. Conclusions 297

8.1 Conclusions 297
8.1.1 Economies of scale at the plant level 297
8.1.2 System average total costs when there are no restrictions on pollution emissions 298
8.1.3 Effect of emission standards on system average total costs 299
8.1.4 System marginal costs 300
8.1.5 Effect of annual Load Factor on system costs: implications for implementing a peak load rate structure 302
8.1.6 Effect of pumped storage on system costs 302
8.1.7 Effect of transmission losses on system scale economies 303
8.2 Qualifications 303
8.2.1 Static analysis 303
8.2.2 Seasonal demands 304
8.2.3 Interconnections and reserves 304
8.2.4 Distribution 305
8.2.5 Other pollutants and external effects 305
8.2.6 Resource depletion 306
8.3 Extensions 306
8.3.1 Dynamic model 306
8.3.2 Multi-season model 307
8.3.3 Multi-sector model 307
8.3.4 Distribution costs 307

Appendix A. Calculation of emissions for plants with no emissions controls 309

A.1 Fly-ash emissions 309
A.2 Sulphur dioxide emissions 310

Appendix B. Calculation of the income tax element in annual fixed charge factors 311

Appendix C. Calculations for diffusor pumping costs 313

Appendix D. Calculations for nuclear plant capital costs 317
