Preface

v

Chapter One

Spatially-Recorded Images: Some Fundamental Statistical Limitations

	<i>Page</i>
1.1 Ideal arrays of photon counters	1
Introduction	1
Input/Output Relationships	1
The Comparative Noise Level	6
Threshold Limitation	9
1.2 Image density characteristics	12
Density and Gamma	12
Density Fluctuations and Comparative Noise Level	14
1.3 Random array of receptors	17
Three-Dimensional Layers	17
Image Density and Gamma	20
Density Fluctuations and the Comparative Noise Level	22
1.4 Image resolution	24
1.5 Detective quantum efficiency	28
References	30
Exercises	31

Chapter Two

Input/Output Relationships for Conventional Photographic Processes: Experimental Observables

2.1 Properties of silver halide grains	33
Latent Image Formation	33
Quantum Yield and Quantum Sensitivity	35
The Grain Size Distribution	38
2.2 Sensitometric properties of photographic layers	39
Image Density and the Nutting Formula	39
The Exposure Scale	46
The Characteristic Curve	47

	Page
2.3 Micro-image properties	53
Adjacency Effects	53
Image Resolution and the Spread Function	55
Image Density Fluctuations	58
Detective Quantum Efficiency	61
References	64
Exercises	65

Chapter Three

Input/Output Relationships for Conventional Photographic Processes: Analytical Models

3.1 Models for single-level grains	68
Introduction	68
DQE for Uniform Grain Array	69
DQE for Random Grain Array	70
Influence of Sensitivity Distribution	72
Model including Grain Size Distribution	74
3.2 The characteristic curve	76
Basic Theory	76
Constant Grain Size and Sensitivity	79
Variable Grain Sensitivity	81
Variable Grain Size	83
Number and Size of Image Grains	88
Grain-Volume Absorption of Quanta	89
Grain-Size Amplifications	92
Exposure Distribution in the Layer	94
Influence of Fog Grains	94
3.3 Image noise characteristics	96
Basic Theory	96
The Siedentopf Relationship	98
Influence of Layer Parameters	99
Size Amplification Factors	103
3.4 Detective quantum efficiency	106
Formulation	106
Influence of Layer Parameters	107
3.5 Modelling unconventional processes	111
References	111
Exercises	113

*Chapter Four***Quantum Sensitivity and Ultimate Photographic Sensitivity**

	<i>Page</i>
4.1 Measurement of quantum sensitivity	116
Experimental Techniques	116
Analysis of Results	118
Sensitivity Distributions	123
4.2 Interpretation of quantum sensitivity	125
Problems of Interpretation	125
Simple Model of Sensitivity Distribution	126
Quantum Sensitivity and the Characteristic Curve	129
Quantum Sensitivity and DQE	132
4.3 Ultimate photographic sensitivity	135
Some Estimates	135
Speed and Resolution	137
Ultimate Sensitivity and DQE	141
Exposure Addition and Multiplication	144
4.4 Sensitivity and DQE for two-stage processes	145
Two-Stage Imaging	145
DQE Transfer	146
Implications	147
References	148
Exercises	150

*Chapter Five***Detective Quantum Efficiency, Signal-to-Noise Ratio, and the Noise-Equivalent Number of Quanta**

5.1 Detective quantum efficiency and signal-to-noise ratio	152
Introduction	152
S/N Ratio Analysis	152
Noise-Equivalent Number of Quanta	156
S/N Ratio Optimization	158
5.2 Detection problems	162
Contrast and Energy Detectivity	162
Pre-Exposure Advantages	165
Practical Detection Techniques	168
5.3 Noise-equivalent quanta and quantum noise	171
X-Rays and Unconventional Exposures	171
Role of Photon Noise	176
Photon Noise Amplification	178
Photographic Amplifying Factors	182
References	185
Exercises	188

*Chapter Six***Fourier Transforms, and the Analysis of Image Resolution and Noise**

	<i>Page</i>
6.1 Fourier transforms	190
Introduction	190
Definitions	191
Two Dimensional Transforms	194
Properties of Transforms	196
The Sampling Theorem	197
Computational Methods	198
Computational Examples	201
6.2 Input-output relationships for linear stationary systems	204
Basic Theory	204
The Line Spread Function	209
The Modulation Transfer Function	211
Symmetry Properties	213
6.3 Noise analysis	215
Random Processes	215
First Order Statistics	217
The Autocorrelation Function	220
The Wiener Spectrum	222
Symmetry Properties	223
Computational Examples	224
References	227
Recommended Reading	229
Exercises	229

*Chapter Seven***The Modulation Transfer Function**

7.1 Linearity of the photographic process	232
Input and Output Parameters	232
A One-Stage Model	233
A Two-Stage Model	236
Adjacency Effects	237
A Three-Stage Model	246
7.2 Measurement of the MTF	241
Sine Wave Methods	241
Spread Function Methods	244
Coherent Light Methods	247
Practical Results	249
Influence of Image Noise	255
7.3 Analysis and application of the MTF	258
Empirical MTF Models	258
Monte Carlo MTF Models	260

CONTENTS

xiii

	Page
Practical Resolution Criteria	263
Systems Cascade of MTFs	267
References	269
Exercises	273

*Chapter Eight***Image Noise Analysis and the Wiener Spectrum**

8.1 Photographic Wiener spectrum relationships	276
Introduction	276
One-Dimensional Scans	277
The Wiener Spectrum and the Noise Parameter, G	280
Transmittance and Density Fluctuations	283
8.2 Measurement of the Wiener spectrum	284
The Scale Value	284
Analogue Methods	288
Digital Methods	292
Practical Results	298
8.3 Analysis and application of the Wiener spectrum	303
Wiener Spectrum Models	303
Wiener Spectrum Transfer	307
The Wiener Spectrum and DQE	311
References	314
Exercises	317

*Chapter Nine***Microdensitometry**

9.1 Design of conventional microdensitometers	320
Single and Double Beam Instruments	320
Digital Systems	324
9.2 Theory of imaging in microdensitometers	325
Effects of Partial Coherence	325
The Microdensitometer Transfer Function	330
Correction for Microdensitometer Degradation	334
9.3 Special features and instruments	336
Automatic Focussing and Alignment	336
Other Special Features	339
References	340
Exercises	342

*Chapter Ten***Image Assessment by Information Theory**

	<i>Page</i>
10.1 The information theory approach	344
Introduction	344
Relevance to Photography	345
10.2 Shannon's theorems	346
Measure of Information	346
The Zero-Memory Information Source	348
Markov Information Sources	350
Communication Channels	352
The Influence of Noise	353
Power-Limited Signals, Gaussian Noise	356
10.3 Photographic applications: discrete signals	357
Information Storage Cells	357
Binary and Multilevel Recording	360
Problem of Coding	363
10.4 Photographic applications: continuous signals	364
Spatial Frequency Analysis	364
Information and DQE	366
Small Signals	368
Maximum Information Capacity	372
Practical Applications	374
References	376
Exercises	387
Appendix	381
<i>Author Index</i>	387
<i>Subject Index</i>	395
