CONTENTS

Introduction to the series v
Preface vii

1. *The solution of linear systems* 1
   1.1. General linear systems and canonical forms 1
   1.2. Reduction to canonical form 2
   1.3. Example of a reduction to canonical form 6
   1.4. Dependent equations and cases of no solution 8
   1.5. Relations with other solution methods 11
   1.6. The value of a linear function 13
   1.7. A matrix formulation of transformations 14
   1.8. Numerical example 17
   1.9. Artificial variables 20
   1.10. Relations between equivalent canonical forms 21
   1.11. The value of a linear function in matrix formulation 24
   1.12. Canonical systems and determinants 25

2. *The simplex method for linear programming* 31
   2.1. The linear programming problem: an example of production planning 31
   2.2. General formulation of linear programming problems 33
   2.3. Introduction to the simplex method 35
   2.4. Simplex tableaux and rules for the simplex method 40
   2.5. Termination of the simplex method 45
   2.6. Alternative optimal solutions 46
   2.7. Matrix formulation of the simplex method 49

3. *Variants of the simplex method* 57
   3.1. A typical minimization problem: the composition of minimum-cost cattlefeed 57
   3.2. Starting methods using artificial variables 60
   3.3. Alternative methods for finding a feasible solution 69
   3.4. Alternatives for selection of the new basic variable 72
   3.5. Degeneracy in the simplex method 74
   3.6. The simplex method for problems with upper-bound constraints 80

4. *Duality in linear programming and the dual method* 89
   4.1. Opportunity costs 89
   4.2. Dual problems 94
   4.3. Interpretation of dual problems 97
   4.4. Relations between primal and dual problems 99
   4.5. The dual method 104
   4.6. Dual variables and Lagrangean multipliers 114
   4.7. Dual upper and lower bounds 116

5. Sensitivity analysis and parametric programming 125
5.1. Sensitivity analysis of the objective function 125
5.2. Sensitivity analysis of constant terms 128
5.3. Programming with a parametric objective function 131
5.4. Numerical example 136
5.5. Some proofs 142
5.6. Parametric constant terms 145
5.7. Parametric variations of constraint coefficients 151

6. Parametric methods for linear programming 157
6.1. The primal-dual method 157
6.2. The original formulation of the primal-dual method 161
6.3. Parametric equivalence 165
6.4. The dual equivalent of the primal-dual method 172
6.5. The parametric and dual equivalents of the primal-dual method 179
6.6. The gradient method and its equivalent methods 185
6.7. The capacity method and its equivalent methods 192
6.8. Self-dual parametric methods 197

7. Post-optimality analysis, the reverse simplex method and related methods 202
7.1. Post-optimality analysis via the reverse simplex method 202
7.2. A method based on graph theory 213
7.3. The reverse simplex method for the generation of extreme points of a system of inequalities 221
7.4. The reverse dual method 226

8. Quadratic forms 232
8.1. Introduction 232
8.2. Reduction to diagonal form 236
8.3. Completing the square and pivoting 242
8.4. Diagonalization of nonhomogeneous quadratic forms 245
8.5. Maximization of a quadratic form 248
8.6. Maximizing quadratic forms subject to linear equalities 255

9. The simplex and the dual method for quadratic programming 261
9.1. Introduction 261
9.2. The first symmetric variant of the simplex method for quadratic programming 270
9.3. The asymmetric variant 280
9.4. The second symmetric variant 285
9.5. Duality in quadratic programming 288
9.6. Dual methods for quadratic programming 291

10. Parametric quadratic programming 297
10.1. The symmetric variant of parametric quadratic programming 297

10.2. The asymmetric and second symmetric variants of parametric quadratic programming 304

11. Parametric methods for quadratic programming *310*
11.1. Introduction 310
11.2. The primal-dual, gradient and capacity methods for quadratic programming 311
11.3. Parametric equivalence in quadratic programming 313
11.4. The self-dual parametric method for quadratic programming 318
11.5. Cottle's index method 322

12. Some other quadratic programming methods *331*
12.1. Beale's quadratic programming method 331
12.2. A reformulation 334
12.3. Comparison with the simplex method 340
12.4. A combinatorial method 346

13. Multiparametric linear and quadratic programming *352*
13.1. Linear problems with multiparametric constant terms 352
13.2. A node method for multiparametric programming 359
13.3. Numerical example 363
13.4. A multiparametric objective function 367
13.5. Multiparametric quadratic programming 368

14. Concave quadratic programming *373*
14.1. Convex and concave functions 373
14.2. The simplex method for concave problems 377
14.3. Ritter's method for concave quadratic programming 381
14.4. Numerical example and counter-example 386
14.5. Tui's method for concave quadratic programming 392
14.6. The composite version of Tui's method 396

15. General quadratic programming *400*
15.1. The simplex method for finding a local maximum 400
15.2. Conditions for local optima 402
15.3. Optimal solutions and latent roots 403
15.4. The solution of Ritter's auxiliary problem 406
15.5. Outline of the parametric method for general quadratic programming 408
15.6. Diagonalization 412
15.7. Numerical example 415
15.8. Concluding remarks 424

16. The linear complementarity problem, I *426*
16.1. Introduction 426
16.2. The case of negative principal pivots 428

16.3. The negative semi-definite case 432
16.4. The general case with nonincreasing λ 433
16.5. P- and P_0-matrices 440
16.6. Uniqueness of solution for P_0-matrices 442

17. The linear complementarity problem, II 443
17.1. The Lemke approach to the parametric method 443
17.2. The complementary variant with nonzero principal elements 445
17.3. The complementary variant in the general case: examples 447
17.4. General discussion of the complementary variant 452
17.5. Equivalence of the complementary and the nearly complementary variant 454
17.6. Infeasibility tests 457
17.7. Rules for the complementary variant 460

18. Termination for copositive plus and $\mathcal{L}$-matrices 462
18.1. Introduction 462
18.2. Termination in the λ-column 463
18.3. Termination in a column of a nonbasic variable 466
