

Contents

1	Nucleic Acid Structure and Function	1
1.1	Structure of nucleic acids	1
1.1.1	DNA	1
1.1.2	RNA	3
1.1.3	Hydrophobic interactions	3
1.1.4	Different forms of the double helix	5
1.1.5	Supercoiling	6
1.1.6	Denaturation and hybridization	10
1.1.7	Orientation of nucleic acid strands	11
1.2	Replication of DNA	12
1.2.1	Unwinding and rewinding	13
1.2.2	Fidelity of replication: proof-reading	13
1.3	Chromosome replication and cell division	14
1.4	DNA repair	19
1.4.1	Mismatch repair	19
1.4.2	Excision repair	19
1.4.3	Recombination (post-replication) repair	19
1.4.4	SOS repair	20
1.5	Gene expression	21
1.5.1	Transcription	22
1.5.2	Translation	26
1.5.3	Post-translational events	32
1.6	Gene organization	34
2	Mutation and Variation	37
2.1	Variation and evolution	37
2.1.1	Fluctuation test	38
2.1.2	Directed mutation in bacteria?	40
2.2	Types of mutations	41
2.2.1	Point mutations	41
2.2.2	Conditional mutants	42
2.2.3	Variation due to larger scale DNA alterations	44
2.2.4	Extrachromosomal agents and horizontal gene transfer	44
2.3	Phenotypes	45

2.4	Restoration of phenotype	47
2.4.1	Reversion and suppression	47
2.4.2	Complementation	49
2.5	Recombination	49
2.6	Mechanisms of mutation	50
2.6.1	Spontaneous mutation	50
2.6.2	Chemical mutagens	52
2.6.3	Ultraviolet irradiation	54
2.7	Isolation and identification of mutants	58
2.7.1	Mutation and selection	58
2.7.2	Replica plating	59
2.7.3	Penicillin enrichment	61
2.7.4	Isolation of other mutants	62
2.7.5	Molecular methods	62
3	Regulation of Gene Expression	67
3.1	Gene copy number	69
3.2	Transcriptional control	70
3.2.1	Promoters	70
3.2.2	Terminators, attenuators and anti-terminators	77
3.2.3	Induction and repression: regulatory proteins	79
3.2.4	Attenuation: <i>trp</i> operon	87
3.2.5	Two-component regulatory systems	92
3.2.6	Global regulatory systems	94
3.2.7	Feast or famine and the RpoS regulon	95
3.2.8	Quorum sensing	95
3.3	Translational control	99
3.3.1	Ribosome binding	99
3.3.2	Codon usage	101
3.3.3	Stringent response	101
3.3.4	Regulatory RNA	102
3.3.5	Phase variation	102
4	Genetics of Bacteriophages	103
4.1	Single-stranded DNA bacteriophages	106
4.1.1	ϕ X174	106
4.1.2	M13	109
4.2	RNA-containing phages: MS2	109
4.3	Double-stranded DNA phages	110
4.3.1	Bacteriophage T4	110
4.3.2	Bacteriophage lambda	113
4.3.3	Lytic and lysogenic regulation of bacteriophage lambda	118
4.4	Restriction and modification	125
4.5	Complementation and recombination	128
4.6	Why are bacteriophages important?	130
4.6.1	Phage typing	131

4.6.2	Phage therapy	131
4.6.3	Phage display	132
4.6.4	Bacterial virulence and phage conversion	133
5	Plasmids	137
5.1	Some bacterial characteristics are determined by plasmids	137
5.1.1	Antibiotic resistance	137
5.1.2	Colicins and bacteriocins	138
5.1.3	Virulence determinants	138
5.1.4	Plasmids in plant-associated bacteria	139
5.1.5	Metabolic activities	139
5.2	Molecular properties of plasmids	141
5.2.1	Plasmid replication and control	143
5.3	Plasmid stability	154
5.3.1	Plasmid integrity	155
5.3.2	Partitioning	157
5.3.3	Differential growth rate	160
5.4	Methods for studying plasmids	161
5.4.1	Associating a plasmid with a phenotype	161
5.4.2	Classification of plasmids	163
6	Gene Transfer	165
6.1	Transformation	166
6.2	Conjugation	167
6.2.1	Mechanism of conjugation	168
6.2.2	The F plasmid	173
6.2.3	Conjugation in other bacteria	174
6.3	Transduction	178
6.3.1	Specialized transduction	180
6.4	Recombination	181
6.4.1	General (homologous) recombination	181
6.4.2	Site-specific and non-homologous (illegitimate) recombination	186
6.5	Mosaic genes and chromosome plasticity	187
7	Genomic Plasticity: Movable Genes and Phase Variation	189
7.1	Insertion sequences	189
7.1.1	Structure of insertion sequences	189
7.1.2	Occurrence of insertion sequences	190
7.2	Transposons	192
7.2.1	Structure of transposons	194
7.2.2	Integrans	196
7.3	Mechanisms of transposition	197
7.3.1	Replicative transposition	197
7.3.2	Non-replicative (conservative) transposition	200
7.3.3	Regulation of transposition	201
7.3.4	Activation of genes by transposable elements	203

7.3.5	Mu: a transposable bacteriophage	204
7.3.6	Conjugative transposons and other transposable elements	205
7.4	Phase variation	205
7.4.1	Variation mediated by simple DNA inversion.	207
7.4.2	Variation mediated by nested DNA inversion	208
7.4.3	Antigenic variation in the gonococcus	208
7.4.4	Phase variation by slipped strand mispairing	211
7.4.5	Phase variation mediated by differential DNA methylation	214
8	Genetic Modification: Exploiting the Potential of Bacteria	215
8.1	Strain development	215
8.1.1	Generation of variation	215
8.1.2	Selection of desired variants	216
8.2	Overproduction of primary metabolites	216
8.2.1	Simple pathways	217
8.2.2	Branched pathways	218
8.3	Overproduction of secondary metabolites	220
8.4	Gene cloning	221
8.4.1	Cutting and joining DNA	222
8.4.2	Plasmid vectors	223
8.4.3	Transformation	225
8.4.4	Bacteriophage lambda vectors	225
8.4.5	Cloning larger fragments	227
8.4.6	Bacteriophage M13 vectors	229
8.5	Gene libraries	229
8.5.1	Construction of genomic libraries	229
8.5.2	Screening a gene library	231
8.5.3	Construction of a cDNA library	233
8.6	Products from cloned genes	234
8.6.1	Expression vectors	234
8.6.2	Making new genes	236
8.6.3	Other bacterial hosts	239
8.6.4	Novel vaccines	241
8.7	Other uses of gene technology	242
9	Genetic Methods for Investigating Bacteria	245
9.1	Metabolic pathways	245
9.1.1	Complementation	246
9.1.2	Cross-feeding	246
9.2	Microbial physiology	247
9.2.1	Reporter genes	249
9.2.2	Lysogeny	250
9.2.3	Cell division	251
9.2.4	Motility and chemotaxis	252
9.2.5	Cell differentiation	253

9.3	Bacterial virulence	257
9.3.1	Wide range mechanisms of bacterial pathogenesis	257
9.3.2	Detection of virulence genes	259
9.4	Specific mutagenesis	262
9.4.1	Gene replacement	262
9.4.2	Antisense RNA	264
9.5	Taxonomy, evolution and epidemiology	264
9.5.1	Molecular taxonomy	264
9.5.2	Diagnostic use of PCR	267
9.5.3	Molecular epidemiology	267
10	Gene Mapping to Genomics	273
10.1	Gene mapping	273
10.1.1	Conjugational analysis	273
10.1.2	Co-transformation and co-transduction	276
10.1.3	Molecular techniques for gene mapping	277
10.2	Gene sequencing	279
10.2.1	DNA sequence determination	281
10.2.2	Genome sequencing	282
10.2.3	Comparative genomics	285
10.2.4	Bioinformatics	288
10.3	Physical and genetic maps	289
10.3.1	Deletions and insertions	290
10.3.2	Transposon mutagenesis	290
10.3.3	Gene replacement	292
10.3.4	Site-directed mutagenesis	292
10.4	Analysis of gene expression	292
10.4.1	Transcriptional analysis	293
10.4.2	Translational analysis	296
10.4.3	Systematic analysis of gene function	300
10.5	Conclusion	300
Appendix A	Further Reading	301
Appendix B	Abbreviations	305
Appendix C	Glossary	309
Appendix D	Enzymes	323
Appendix E	Genes	327
Appendix F	Standard Genetic Code	331
Appendix G	Bacterial Species	333
