<b>Preface</b>	<b>ix</b>
<b>Acknowledgments</b>	<b>xi</b>
<b>Summary</b>	<b>1</b>
The Scientific Framework and Very-Long-Term Warming	4
Economic Damage	5
Abatement Costs	6
Time Discounting	7
Benefit-Cost Synthesis	8
Policy Implications	9
<b>1 The Scientific Basis for the Greenhouse Effect</b>	<b>11</b>
Science and the Emergence of the Policy Issue	13
The Greenhouse Effect	15
The Carbon Cycle	16
Other Trace Gases	17
General Circulation Models	19
Radiative Forcing and Global Warming	20
Feedback Estimates	22
Aerosols and Masking by Urban Pollution	25
The Empirical Evidence	26
The Ecological and Economic Impact	30
Critiques and Response	32
Very-Long-Term Warming	33
Catastrophe Scenarios	34
Unavoidable Warming	35
Geoengineering	36
Scientific Research Agenda	38
Conclusion	40
<b>2 Global Warming in the Very Long Term</b>	<b>41</b>
Fossil Fuel Supply	45
Establishing the Appropriate Time Horizon	46
Carbon Emissions and Atmospheric Concentration	50

Very-Long-Term Warming	54
The Influence of CFCs	59
Illustrative Regional Extent of Very-Long-Term Warming	61
Nonlinear Impact	72
Avoiding Long-Term Warming	73
The Pace of Warming and the Price of Delaying Action	75
<i>Caveat Lector</i>	76
 <b>3 The Economic Benefits of Limiting Global Warming</b>	 <b>79</b>
Analytical Framework	82
Inherent Damage Limits?	86
Agriculture	87
Forests	101
Species Loss	104
Sea-Level Rise	107
Space Cooling and Heating	112
Human Amenity	115
Life and Morbidity	116
Migration	119
Hurricane Damage	120
The Construction Sector	122
Leisure Activities	122
Water Supply	123
Urban Infrastructure	127
Pollution	128
Overview	130
Annex 3A	
The Welfare Effects of Agricultural Yield Reductions Resulting from Global Warming	134
 <b>4 Economic Models of Carbon Reduction Costs:</b>	
<b>An Analytical Survey</b>	<b>139</b>
Analytical Framework	141
Principal Models	152
Synthesis of Findings	185
Conclusion	191
Annex 4A	
Nonlinearity of the Carbon Tax Curve	192

<b>5 Carbon Abatement Costs: Engineering Estimates and Forestry Options</b>	<b>195</b>
Attainable Efficiency Gains and Carbon Reductions: Illustrations	199
An Overview of Potential Carbon Reductions	203
Implementation: Obstacles and Instruments	214
Forestry Measures	216
A Synthesis of Abatement Costs	227
Conclusion	232
<b>6 Time Discounting for Global Warming Analysis</b>	<b>233</b>
Investment Versus Consumption Sourcing	236
Issue- and Policy-Specific Discount Rates	238
Intergenerational Comparison	238
The Environmental Complication	240
Preferred Method	243
Shadow Pricing Capital Effects	245
Estimating the Social Rate of Time Preference	247
Relationship to Discounted Utility Maximization	255
Reality Check: An Intuitive Approach	256
Observed Market Rates	257
A Declining Social Rate of Time Preference?	262
Policy Differences Among Government Entities	263
The Investment Fund Alternative	265
Overview	266
Annex 6A	
Shadow Pricing Capital in Benefit-Cost Analysis:	
A Note on Bradford Versus Lind	270
<b>7 Benefit-Cost Synthesis</b>	<b>275</b>
General Approach	277
The Benefit-Cost Model	278
Variable Baselines and Parameter Values	284
Adaptation	295
Benefit-Cost Results	296
Policy Choice Under Uncertainty with Risk Aversion	297
Sensitivity Analysis	301
Catastrophe Analysis	303
A Malthusian Scenario	305
Comparison With the Nordhaus Results	307

Insurance and the Value of Information	309
Overview	311
Annex 7A	
The Nordhaus Optimal Emissions Models	312
Annex 7B	
The Manne-Richels Model of Greenhouse Insurance	318
<b>8 Toward an International Policy Strategy</b>	<b>321</b>
Overarching Issues	324
Achieving Cooperation	325
Efficient and Equitable Mechanisms to Limit Emissions	346
Global Development Context	357
The State of Play	361
A Blueprint for Action	367
Other Greenhouse Gases	375
Conclusion	376
Postscript	378
<b>References</b>	<b>381</b>
<b>Index</b>	<b>393</b>
<b>Tables</b>	
2.1 Global warming in the very long term	52
2.2 Increases in July average daily maximum temperature from very-long-term global warming for 66 US cities	68
2.3 Increase in mean daily summer maximum temperature from very-long-term global warming in 60 cities worldwide	70
2.4 Commitment to global warming under alternative scenarios	74
3.1 Estimates of agricultural yield changes from global warming, various countries	98
3.2 Rough estimate of the impact of carbon-dioxide-equivalent doubling on agriculture, selected countries	99
3.3 Costs associated with a one-meter rise in sea level, selected countries and territories	111
3.4 Estimates of annual damage from global warming to the US economy at 1990 scale	131
4.1 Nordhaus cost function for greenhouse gas reduction	168

4.2	Alternative cost estimates for reductions in carbon emissions, 1990–2100	186
4.3	Stylized parameters for carbon reduction costs	190
5.1	Energy consumption in the United States, by type, 1988	200
5.2	Alternative estimates of the scope for energy savings and carbon reduction in the United States	204
5.3	Alternative estimates of US emissions reductions resulting from National Academy of Sciences moderate-cost measures	209
5.4	Afforestation costs in the United States	222
5.5	Alternative estimates of global costs of carbon reductions, 2025–2100	229
5.6	Forestry options: carbon reduction and global costs, 1990–2100	230
6.1	Impact of time discounting over 200 years	236
6.2	Weighted consumer discount rate: premium above Treasury bill	260
7.1	Central features of the benefit-cost analysis	279
7.2	Variables and parameter values	290
7.3	Results of benefit-cost analyses of abatement of greenhouse warming, principal cases	298
7.4	Sensitivity analysis of benefits and costs of abatement of greenhouse warming	302
7A.1	Nordhaus model equations	313
8.1	The top 50 carbon-emitting countries	330
8.2	Mean temperature increase under carbon-dioxide-equivalent doubling, various countries and regions	333
8.3	Future carbon emissions, excluding deforestation, by region	337
8.4	Country policy positions on greenhouse warming as of mid-1991	362

## Figures

1.1	Temperature variations in the northern hemisphere, 1880–1990	29
2.1	Carbon dioxide production under alternative fossil fuel consumption scenarios	47
2.2	Atmospheric carbon dioxide concentrations under alternative fossil fuel consumption scenarios	48
2.3	Carbon dioxide concentration and radiative forcing in the very long term	59
2.4	Radiative forcing from all greenhouse gases and commitment to equilibrium global mean temperature rise in the very long term	60

2.5	Equilibrium warming for carbon-dioxide-equivalent doubling, Western Hemisphere: June–August	63
2.6	Equilibrium warming for carbon-dioxide-equivalent doubling, Eastern Hemisphere: June–August	64
2.7	Equilibrium warming for carbon-dioxide-equivalent doubling, Western Hemisphere: December–February	65
2.8	Equilibrium warming for carbon-dioxide-equivalent doubling, Eastern Hemisphere: December–February	66
3A.1	Welfare effects of lower agricultural yields under constant costs	135
3A.2	Welfare effects of lower agricultural yields with diminishing returns	137
4.1	Carbon taxes, revenues, and economic cost	148
4.2	Alternative estimates of the output costs of reducing carbon emissions	184
4A.1	The marginal product of carbon	193
5.1	Hypothetical carbon reduction cost curves	198
5.2	Engineering-based estimates of carbon reduction costs	212
5.3	Economics of afforestation for carbon sequestration	218
6.1	The trade-off between environmental and other goods and services	242
7.1	Costs and benefits of aggressive abatement of greenhouse warming, 1990–2270	280
8.1	Prisoners' dilemma: payoff matrix	326
8.2	Benefits and costs of abatement of greenhouse warming with and without free riding	327
8.3	Fossil fuel elasticities and the carbon tax	349
