|--------------------------------------------------------------------|-----|
| <b>PART I. INTEGRAL EQUATIONS</b>                                  | 9   |
| <b>Chapter 1. General results on linear integral equations</b>     | 9   |
| §1. Compact operators and Fredholm's theorems                      | 9   |
| §2. The concept of symbol. Examples                                | 16  |
| §3. Regularization                                                 | 19  |
| §4. The index of an operator                                       | 23  |
| §5. Noether operators and Noether's theorems                       | 27  |
| <b>Chapter 2. One-dimensional singular integral equations</b>      | 28  |
| §1. The Cauchy operator on Hoelder functions                       | 28  |
| §2. Cauchy operator in $L_2$ . The general singular operator       | 33  |
| §3. Symbol and regularization                                      | 40  |
| §4. Introduction to boundary value problems                        | 43  |
| §5. Evaluation of the index                                        | 46  |
| §6. Systems of singular equations                                  | 49  |
| §7. Equations on open contours and with discontinuous coefficients | 50  |
| §8. Wiener-Hopf integral equations                                 | 59  |
| §9. Factorization of functions and matrix functions                | 66  |
| <b>Chapter 3. Two-dimensional singular integral equations</b>      | 76  |
| §1. Brief survey of results                                        | 76  |
| §2. Definition and basic properties of two-dimensional integrals   | 77  |
| §3. Singular integrals over Hoelderian functions                   | 80  |
| §4. Differentiation of integrals with weak singularities           | 86  |
| §5. Singular integrals in the space of square summable functions   | 88  |
| §6. Symbol and regularization                                      | 97  |
| §7. The index of a singular operator                               | 102 |
| §8. Singular integrals on a smooth surface without edge            | 106 |
| §9. Matrix singular operators of systems of singular equations     | 108 |

|                                                                                                      |            |
|------------------------------------------------------------------------------------------------------|------------|
| <b>Chapter 4. Approximate solution of integral equations . . .</b>                                   | <b>114</b> |
| §1. Computation of singular integrals . . . . .                                                      | 114        |
| §2. The most important methods of solution of singular<br>equations . . . . .                        | 117        |
| §3. On projection methods of solution of Wiener-Hopf<br>equations . . . . .                          | 120        |
| <b>PART II. PROBLEMS OF THE THEORY OF ELASTICITY<br/>        AND CRACKS MECHANICS . . . . .</b>      | <b>128</b> |
| <b>Chapter 5. The integral equations of classical<br/>        two-dimensional problems . . . . .</b> | <b>128</b> |
| §1. The plane problem of the theory of elasticity . . . . .                                          | 128        |
| §2. Complex representation . . . . .                                                                 | 136        |
| §3. Integral equations of N.I. Muskhelishvili . . . . .                                              | 139        |
| §4. Generalization to multiply connected regions . . . . .                                           | 143        |
| §5. The potential theory equations of N.I. Muskhelishvili . . . .                                    | 147        |
| §6. The equations of Lauricella-Sherman . . . . .                                                    | 149        |
| §7. Plane strain in anisotropic media . . . . .                                                      | 152        |
| <b>Chapter 6. Potential theory for basic three-dimensional<br/>        problems . . . . .</b>        | <b>165</b> |
| §1. The equilibrium equations in terms of displacements . . . .                                      | 165        |
| §2. Fundamental solutions of the equations of the theory<br>of elasticity . . . . .                  | 172        |
| §3. Lichtenstein's boundary integral equations . . . . .                                             | 174        |
| §4. Solution of space problems by the potential method . . . .                                       | 177        |
| §5. Direct methods of construction of the boundary integral<br>equations . . . . .                   | 189        |
| §6. New schemes for the classical space problems . . . . .                                           | 192        |
| §7. On non-classical integral equations of the theory of<br>elasticity . . . . .                     | 196        |
| <b>Chapter 7. The contact problems of the theory<br/>        of elasticity . . . . .</b>             | <b>200</b> |
| §1. Mathematical formulation of problems . . . . .                                                   | 200        |
| §2. Formulation of variational problems . . . . .                                                    | 207        |
| §3. The integral equations of the simplest contact problems . .                                      | 211        |

|                                                                                                                                                      |            |
|------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| §4. Reduction of sectionally homogeneous problems to integral equations . . . . .                                                                    | 214        |
| §5. The new singular integral equations of contact problems of the theory of elasticity . . . . .                                                    | 222        |
| §6. On a method of successive approximations for the solution of 3D-problems . . . . .                                                               | 224        |
| <b>Chapter 8. Problems of the theory of cracks . . . . .</b>                                                                                         | <b>229</b> |
| §1. Muskhelishvili's integral equations . . . . .                                                                                                    | 229        |
| §2. The equations for branching cracks . . . . .                                                                                                     | 240        |
| §3. Problem of a crack in a layered medium . . . . .                                                                                                 | 245        |
| §4. The problem of elastic inclusions with sharp points . . . . .                                                                                    | 257        |
| §5. Space problems of the theory of cracks . . . . .                                                                                                 | 263        |
| <b>APPENDIX I. Cosserat spectrum . . . . .</b>                                                                                                       | <b>273</b> |
| §1. The investigations of Eugene and Francis Cosserat . . . . .                                                                                      | 276        |
| §2. Problem I for finite regions . . . . .                                                                                                           | 281        |
| §3. Isolated points of the essential Cosserat spectrum . . . . .                                                                                     | 291        |
| §4. The second boundary value problem . . . . .                                                                                                      | 294        |
| §5. The case of infinite regions . . . . .                                                                                                           | 302        |
| §6. Plane problems . . . . .                                                                                                                         | 306        |
| §7. A qualitative study of the solutions for Poisson coefficients with values near $1/2$ . . . . .                                                   | 310        |
| <b>APPENDIX II. The Calderon-Seely projectors and the reduction of boundary value problems of elliptic operators to boundary equations . . . . .</b> | <b>312</b> |
| §1. Basic principles of the reduction on a boundary . . . . .                                                                                        | 318        |
| §2. The difference potentials method . . . . .                                                                                                       | 332        |
| §3. The Sokhotskii-Plemelj theorems and the theorem on the involutions of the boundary operator in electro-elasticity . . . . .                      | 341        |
| <b>References . . . . .</b>                                                                                                                          | <b>357</b> |
| <b>Index . . . . .</b>                                                                                                                               | <b>372</b> |
