

Contents

Introduction	1
Notational remarks	7
1. Basic definitions	8
2. Full bundles and bundles with completely regular base spaces	22
3. Bundles with locally paracompact base spaces	28
4. Stone - Weierstraß theorems for bundles	39
5. An alternative description of spaces of sections: Function modules	44
6. Some algebraic aspects of Ω -spaces	60
7. A third description of spaces of sections: $C(X)$ - convex modules	62
8. $C(X)$ -submodules of $\Gamma(p)$	80
9. Quotients of bundles of $C(X)$ -modules	86
10. Morphisms between bundles	95
11. Bundles of operators	112
12. Excursion: Continuous lattices, and bundles	136
13. M-structure and bundles	144
14. An adequate M-theory for Ω -spaces	154
15. Duality	159
16. The closure of the "unit ball" of a bundle and separation axioms	183
17. Locally trivial bundles: A definition	200
18. Local linear independence	202
19. The space $Mod(\Gamma(p), C(X))$	209
2C. Internal duality of $C(X)$ -modules	232

21. The dual space $\Gamma(p)'$ of a space of sections	252
Appendix: Integral representation of linear functionals on a space of sections (by Gerhard Gierz and Klaus Keimel)	260
