TABLES OF CONTENTS

PART 1. Stationary point processes and Palm probabilities 1

1. Stationary marked point processes 2

1.1. The canonical space of point processes on $\mathbb{R}$
1.2. Stationary point processes
1.3. Stationary marked point processes
1.4. Two properties of stationary point processes

2. Intensity 7

2.1. Intensity of a stationary point process
2.2. Intensity measure of a stationary marked point process

3. Palm probability 8

3.1. Mecke's definition
3.2. Invariance of the Palm probability
3.3. Campbell's formula
3.4. The exchange formula (or cycle formula) and Wald's equality

4. From Palm probability to stationary probability 13

4.1. The inversion formula
4.2. Feller's paradox
4.3. The mean value formulae
4.4. The inverse construction

5. Examples 18

5.1. Palm probability of a superposition of independent point processes
5.2. Palm probability associated with selected marks
5.3. Palm probability of selected transitions of a Markov chain

6. Local aspects of Palm probability 21

6.1. Korolyuk and Dobrushin's infinitesimal estimates
6.2. Conditioning at a point

7. Characterization of Poisson processes 23

7.1. Predictable σ-fields
7.2. Stochastic intensity and Radon-Nikodym derivatives
7.3. Palm view at Watanabe's characterization theorem

8. Ergodicity of point processes 27

8.1. Invariant events
8.2. Ergodicity under the stationary probability and its Palm probability
8.3. The cross ergodic theorem

References for Part 1 : Palm probabilities 31

PART 2. Stationary queueuing systems 33

1. The G/G/1/∞ queue : construction of the customer stationary state 34

1.1. Loynes' problem
1.2. Existence of a finite stationary load
1.3. Uniqueness of the stationary load
1.4. Construction points
1.5. Initial workload and long term behaviour

2. Formulae for the G/G/1/∞ queue 40

2.1. Construction of the time-stationary workload
2.2. Little's formulae : the FIFO case
2.3. Probability of emptiness
2.4. Takacs formulae

3. The G/G/s/∞ queue 43

3.1. The ordered workload vector
3.2. Existence of a finite stationary workload vector
3.3. Construction points
3.4. The busy cycle formulae

4. The G/G/1/0 queue 48

4.1. Definition and examples
4.2. Construction of an enriched probability space
4.3. Construction of a stationary solution

5. Other queueing systems 54

5.1. The G/G/∞ pure delay system
5.2. The G/G/1/∞ queue in random environment
5.3. Priorities in G/G/1/∞ : the vector of residual service times
5.4. Optimality properties of the SPRT rule

6. The Bedienungssysteme 62

6.1. The mechanism and the input
6.2. A heuristic description of the dynamics
6.3. The initial generalized state
6.4. The evolution
6.5. Examples

7. The insensitivity balance equations 69

7.1. Stability and regularity assumptions
7.2. Insensitivity balance equations
7.3. Examples
7.4. Assumption on the input
7.5. Two immediate consequences of the insensitivity balance equations

8. The insensitivity theorem 73

8.1. The Palm version
8.2. From Palm to stationary
8.3. The stationary version and Matthes product form

9. Insensitivity balance equations are necessary for insensitivity 77

9.1. The converse theorem
9.2. The method of stages
9.3. Proof of the converse theorem
9.4. Example

10. Poisson streams 84

10.1. Privileged transitions
10.2. Sufficient conditions for Poissonian streams

Appendix 86

1. Change of scale
2. Proof of insensitivity
3. The transition marks
4. Proof of (8.3.5)
5. Proof of (9.1.3)
6. Proof of the converse theorem in the general case
