

# Contents

Introduction	1
1. Symbols and oscillatory integrals	5
2. The method of stationary phase	19
3. Pseudodifferential operators	27
4. Application to elliptic operators and $L^2$ continuity	41
5. Local symplectic geometry I (Hamilton–Jacobi theory)	55
6. The strictly hyperbolic Cauchy problem — construction of a parametrix	67
7. The wavefront set (singular spectrum) of a distribution	77
8. Propagation of singularities for operators of real principle type	89
9. Local symplectic geometry II	97
10. Canonical transformations of pseudodifferential operators	107
11. Global theory of Fourier integral operators	119
12. Spectral theory for elliptic operators	131
Bibliography	145
