<i>Preface to the second edition</i>	vi	10 Mercury – “the metal that slipped away”	168
<i>About the author</i>	ix	11 Eutrophication: the environmental consequences of over-fertilization	180
1 There is no substitute for water	1	12 Erosion: tracking the accelerated movement of material from land to water	229
2 How long is long?	12	13 Species invasions, biomanipulations, and extirpations	247
3 Sediments: an ecosystem’s memory	22	14 Greenhouse gas emissions and a changing atmosphere: tracking the effects of climatic change on water resources	260
4 Retrieving the sedimentary archive and establishing the geochronological clock: collecting and dating sediment cores	30	15 Ozone depletion, acid rain, and climatic warming: the problems of multiple stressors	275
5 Reading the records stored in sediments: the present is a key to the past	48	16 New problems, new challenges	286
6 The paleolimnologist’s Rosetta Stone: calibrating indicators to environmental variables using surface-sediment training sets	74	17 Paleolimnology: a window on the past, a key to our future	310
7 Acidification: finding the “smoking gun”	88	<i>Glossary</i>	314
8 Metals, technological development, and the environment	120	<i>References</i>	324
9 Persistent organic pollutants: industrially synthesized chemicals “hopping” across the planet	146	<i>Index</i>	362
