## Contents

Preface to the second edition About the author		vi ix	10	Mercury – "the metal that slipped away"	168
1	There is no substitute for water	1	11	Eutrophication: the environmental consequences of over-fertilization	180
2	How long is long?	12	12	Erosion: tracking the accelerated movement of material from land to water	
3	Sediments: an ecosystem's memory	22			229
4	Retrieving the sedimentary archive and establishing the geochronological clock: collecting		13	Species invasions, biomanipulations, and extirpations	247
	and dating sediment cores	30	14	Greenhouse gas emissions and a	
5	Reading the records stored in sediments: the present is a key to the past	48		changing atmosphere: tracking the effects of climatic change on water resources	260
6	The paleolimnologist's Rosetta Stone: calibrating indicators to environmental variables using		15	Ozone depletion, acid rain, and climatic warming: the problems of multiple stressors	275
	surface-sediment training sets	74	16	New problems, new challenges	286
7	Acidification: finding the "smoking gun"	88	17	Paleolimnology: a window on the past, a key to our future	310
8	Metals, technological development, and the environment	120	Glossary References Index		314
9	Persistent organic pollutants: industrially synthesized chemicals				324 362
	"hopping" across the planet	146
