Part I Introduction to finite elements

1 Skeletal elements

1.1	What are finite elements?	3
1.2	Element equations by direct operation on differential equations	7
1.3	Assembly of the element equations	12
1.4	Coordinate transformation for inclined elements	13
1.5	The beam: special cases	15
1.6	Duality in skeletal finite elements	16
1.7	Grillage elements	18
1.8	Shear in beam elements	21
1.9	Three-dimensional beam elements	22
1.10	Other skeletal problems in engineering	24
1.11	A simple program for truss analysis	26
1.12	Discussion	29
	References	30

2 Basic relationships for solid continua

2.1	Eulerian and Lagrangian frames of reference	32
2.2	Basic problems in solid mechanics	33
2.3	Three-dimensional elasticity	34
2.4	Plane stress and strain	37
2.5	Axisymmetric solids	38
2.6	Stress resultants in thin plates	39
2.7	Stress resultants in thick plates	41
2.8	Equations for thin shells	43
2.9	Anisotropic materials	44
2.10	Stress transformations	45
	References	48

3 Energy principles and applications

3.1	Theorem of minimum potential energy and virtual work	49
3.2	Duality in continuum finite elements	52
3.3	Energy formulation for spar and beam finite elements	55
3.4	Inclusion of initial and boundary terms in the displacement method	58
3.5	Consistent loads in a beam element	60
3.6	Initial strains	62
3.7	The contact stiffness matrix	63
3.8	Continuity in finite element models	65
3.9	Continuity and errors in finite element solutions	67
3.10	The patch test	72
3.11	Other energy methods	75
3.12	Energy bounds of finite element solutions	79
3.13	General conclusions	80
	References	80

4 Lagrange multipliers, penalty factors, and basis transformation

4.1	Introduction	84
4.2	Penalty factor techniques	85
4.3	Lagrange multiplier techniques	87
4.4	Basis transformation techniques	89
4.5	Demonstration program for constraint techniques	94
4.6	Concluding remarks	96
	References	96

5 Interpolation functions and numerical integration

5.1	Introduction	98
5.2	Constraints in the choice of interpolation functions	99
5.3	Dimensionless interpolations for line elements	102
5.4	Lagrangian interpolation in rectangular and 'brick' elements	109
5.5	Hermitian interpolation in rectangular elements	111
5.6	Coordinate systems for triangles	113
5.7	Langrangian interpolation in triangles	115
5.8	Hermitian interpolation in triangles	118
5.9	Interpolations including normal slopes in triangles	121
5.10	Interpolations including curvatures in triangles	126
5.11	Interpolation functions for tetrahedra and pentahedra	131
5.12	Numerical integration using Gaussian quadrature	133
5.13	Triangular integration	137

5.14	Numerical integration for a beam element	139
5.15	Discussion	140
	References	141

Part II Applications to the statics of solids

6	Plane stress and plane strain	
6.1	The constant strain triangle	145
6.2	The bilinear rectangle	147
6.3	The linear strain triangle	149
6.4	Accuracy of some C_0 plane stress elements	152
6.5	Other elements for plane stress and strain	154
6.6	An example of reduced integration	156
6.7	Concluding remarks	158
	References	159
7	Isoparametric mapping and its applications	
7.1	Isoparametric mapping	161
7.2	Bilinear and biquadratic quadrilaterals	162
7.3	The linear strain triangle	167
7.4	Axisymmetric elements	170
7.5	Isoparametric brick elements	174
7.6	An isoparametric joint element	176
7.7	Application of isoparametric elements to model singularities	178
7.8	Closing remarks	181
	References	182
8	Thin plate bending elements	
8.1	The ACM rectangle	184
8.2	Conforming rectangular elements	186
8.3	Quadrilateral elements	188
8.4	Non-conforming triangle with nine freedoms	190
8.5	Conforming cubic triangular elements	193
8.6	Convergence of some basic thin plate elements	197
8.7	Constant moment element with six freedoms	198
8.8	Quartic element with fifteen freedoms	201
8.9	Quintic element with eighteen freedoms	203
8.10	Nine-freedom element using nested interpolations	206
8.11	Convergence of refined thin plate elements	208
8.12	Closing remarks	212
	References	212

9 Thick plate elements

9.1	Introduction	216
9.2	Rectangular thick plate elements	217
9.3	Triangular thick plate elements	219
9.4	Reduced integration in thick plate elements	224
9.5	Penalty factor techniques	227
9.6	Applications to sandwich plates	229
9.7	Other elements for thick plates	230
	References	230

10 Flat elements for shell analysis

10.1	Introduction	233
10.2	Conical frustum element	234
10.3	Rectangular folded plate elements	238
10.4	Flat triangular elements	239
10.5	The drilling freedom	241
10.6	Triangular element including the drilling freedom	243
10.7	Concluding remarks	247
	References	247

11 Curved shell elements

11.1	Quadratic arch element	249
11.2	Numerical calculation of arch element geometry	252
11.3	Curved axisymmetric shell element	254
11.4	Cylindrical shell elements	257
11.5	Doubly curved triangular shell elements	259
11.6	Quadratic triangular shell element	262
11.7	Quadratic triangular shell element with global coordinate system	264
11.8	Differential geometry of shells	268
11.9	Concluding remarks	270
	References	271

Part III Non-linear and time-dependent problems, and FEM programming

12 Non-linear materials and large displacements

12.1	Introduction	277
12.2	Load stepping techniques	278
12.3	Equilibrium iteration	281
12.4	Non-linear materials	284
12.5	Geometric non-linearity	293

12.6	Stepwise moving frame of reference techniques	295
12.7	Eulerian solution for large displacements	297
12.8	Lagrangian solution for large displacements	300
	References	304
13	Eigenvalue analysis of vibration and stability	
13.1	Introduction	306
13.2	Eigenvalues of finite element stiffness matrices	311
13.3	Mass and damping matrices for finite elements	312
13.4	Natural frequencies of free vibration	314
13.5	Consistent masses versus lumped masses	315
13.6	Eigenvalues of plate vibration	316
13.7	The initial stress matrix	317
13.8	Calculation of the eigenpairs for incipient buckling	320
13.9	Numerical determination of eigenpairs	322
13.10	Extrapolation of eigenvalue solutions	329
13.11	BASIC program for eigenpairs	330
13.12	Other eigenvalue problems	332
	References	333
14	Time stepping analysis of vibration and creep	
14.1	Introduction	335
14.2	Time stepping techniques	336
14.3	Time stepping analysis of structural vibrations	340
14.4	Time stepping analysis of creep	343
14.5	Concluding remarks	345
	References	345
15	Finite element programming	
15.1	Mesh design	347
15.2	Assembly and solution of the element equations	349
15.3	Solution of linear equations	350
15.4	Boundary conditions	353
15.5	Spectrum loadings	354
15.6	Stress sampling points	356
15.7	A BASIC microcomputer program for the quadratic shell element	356
15.8	'FEMSS' programs for plane stress/strain and plate bending	364
15.9	On the choice of element, extrapolation, and singularities	373
15.10	Minimum integrations, reduced integration	374
15.11	Integration in coupled systems	377
	References	378

Part IV Finite elements in fluid flow and other field problems

16 Basic differential equations in continua	
16.1 Introduction	383
16.2 Basic differential equations in solids	384
16.3 Basic equations for general field problems	389
16.4 Equations for the thermohydrodynamic behaviour of fluids	393
16.5 Classification of differential equations	398
16.6 Concluding remarks	399
References	399
17 Variational and weighted residual methods	
17.1 Introduction	400
17.2 Self-adjoint differential equations	402
17.3 Formation of functionals by virtual work	404
17.4 Variational formulation for plane torsion	405
17.5 Weighted residual methods	409
17.6 Application of the Galerkin method to plane torsion	414
17.7 Application of the Galerkin method to fourth-order problems	416
17.8 Concluding remarks	417
References	418
18 Pseudoharmonic field problems	
18.1 Introduction	419
18.2 Steady state heat flow	420
18.3 Transient heat flow	422
18.4 Plane seepage	424
18.5 One-dimensional consolidation	424
18.6 Eigenvalues of electromagnetic vibration	426
18.7 A finite difference method comparison	427
18.8 Discussion	428
References	429
19 Potential flow, viscous flow, and compressible flow	
19.1 Introduction	430
19.2 Inviscid incompressible flow	432
19.3 Harmonic response to seiches	435
19.4 Shallow water circulation	438
19.5 Incompressible viscous flow without inertia	439

19.6	Incompressible viscous flow with inertia	447
19.7	Transient incompressible viscous flow	450
19.8	Incompressible lubrication problems	451
19.9	Inviscid compressible flow	454
19.10	Viscous compressible flow	457
19.11	Concluding remarks	458
	References	459
20	Fluid flow examples and programs	
20.1	Two-dimensional potential flow	462
20.2	One-dimensional solution for plane Couette flow	464
20.3	Hydrodynamic lubrication	465
20.4	Blasius flow	466
20.5	Compressible Couette flow	468
20.6	A simple program for potential flow	470
20.7	'FEMSS' program for Stokes flow	473
	References	478
Part V	Further applications of the finite element method	
21	Boundary solution techniques	
21.1	Introduction	481
21.2	Integral equation solution for a beam	482
21.3	Boundary element method for one-dimensional problems	483
21.4	Application of the boundary element method to beams	486
21.5	Application of BEM to pseudoharmonic problems	488
21.6	Solution of Poisson's equation with boundary elements	491
21.7	Elastic boundary conditions and infinite elements	495
21.8	Concluding remarks	496
	References	496
22	Optimization techniques and applications	
22.1	Classical theory of optimization	498
22.2	Special applications of classical theory	499
22.3	Linear optimization problems	502
22.4	Univariate non-linear problems	505
22.5	Search methods for non-linear problems	506
22.6	Gradient methods for non-linear problems	508
22.7	Constrained non-linear optimization techniques	510
22.8	Predictor-corrector penalty method for constrained optimization	513

22.9	Optimization with finite elements	515
22.10	Penalty optimization of finite element models	518
22.11	Concluding remarks	520
	References	520

23 Generalization of constraint techniques and optimization programs

23.1	Introduction	523
23.2	Problems with discrete constraints	524
23.3	Weighted residual formulations with integral constraints	526
23.4	Variational formulations with integral constraints	529
23.5	Optimization using a condensed Lagrange multiplier formulation	530
23.6	Application of the condensed Lagrange multiplier method to optimization of finite element models	533
23.7	Simple program for truss optimization	534
23.8	Program for optimal arch shapes	540
23.9	Program for optimization of fluid flows	547
23.10	Program for optimization of one-dimensional lubrication	553
23.11	Conclusions	557
	References	559

Appendices

1	Programming for FEMSS using MEGABASIC	565
	References	573
2	Basic equations of the displacement method	574
3	Basic equations for isoparametric elements for plane stress and strain	576
4	Natural equations for thin plates	577
5	Some elementary calculus	579
6	Other problems with a finite element character	584
	References	588

Glossary of symbols	589
