Contents

Special Notation and Symbols

Chapter 1. Basic Terms and Definitions in Genetics **1**

1. Introduction, 1. — 2. Chromosomes and genes, 1. — 3. Genotype and phenotype, 4. Dominance and recessiveness, 4. — 4. Autosomal linkage, 6. Crossing over, 6 — 5. Sex-linked inheritance, 8.

PART I. POPULATION GENETICS. PROBABILITY MODELS

Chapter 2. Probability Models. General Concepts and Definitions **13**

1. Models, 13 — 2. Sample space, random events, probability, 14 — 3. Compound events, 18 — 4. Addition law of probabilities, 22 — 5. Probability distribution of events, 23 — 6. Conditional probability and multiplication law, 24 — 7. Independent events, 25 — 8. Some applications of the probability theory of compound events, 26 — 9. Product of sample space. Joint probability of compound events, 28 — 10. Joint probability distribution, 29 — 11. Marginal probability distributions, 31 — 12. Conditional distributions. Independence, 32 — 13. Genotype and phenotype distributions with respect to two linked loci, 33 — 14. Continuous sample space, 35.

Chapter 3. Genotypes and Phenotypes in Experimental Populations **39**

1. Simple combinatorial problems, 39 — ▼2. Generating functions, 42 — 3. The number of genotypes and phenotypes, 44 — 4. Evaluation of phenotypic ratios in intercrosses and backcrosses, using generating function, 46 — 5. Independence, dependence and interaction, 48 — 6. Epistasis, 52.

Chapter 4. Equilibrium Laws in Panmictic Populations **57**

1. Concept of gene frequency, 57 — 2. Random mating, 59 — ▼ 3. Matrix theory of random mating, 61 — ▼ 4. Gamete and genotype distributions in the *n*th generation under random mating, 65 — 5. Application of matrix algebra in evaluation of the genotype distribution in the *n*th generation for two linked loci, 66 — 6. Gene frequencies in the *n*th generation, 70 — 7. Theorem on genetic equilibrium in a randomly mating population, 71 — 8. Equilibrium for X-linked genes, 75.

Chapter 5. Random Variables and Their Distributions **83**

1. Definition of a random variable, 83 — 2. Probability distribution and cumulative distribution function of a random variable, 85 — 3. Continuous random variable. Density function, 88 — 4. Truncated distributions, 89 — 5. Joint and marginal distributions in a two-dimensional sample space, 91 — 6. Conditional distributions. Independence of random variables, 95 — 7. Distribution of the sum of random variables, 97.

Chapter 6. Moments of Random Variables **102**

1. Expected values, 102 — 2. Definitions of moments, 106 — 3. Variance, 107 — 4. Covariance, 109 — 5. Variance of linear functions of two or more random variables, 112 — 6. Phenotypic and genotypic values of metrical characters, 113 — 7. Additive genetic variance, 114 — ▼ 8. Dominance genetic variance, 116 — 9. Mixtures of two (or more) populations, 117.

Chapter 7. Genotype Distributions for Relatives in Randomly Mating Populations **122**

1. Introduction, 122 — 2. Bayes theorem. *A posteriori* probability, 123 — ▼ 3. Generalized forms of Bayes theorem, 125 — 4. Mating types and their offspring. Single autosomal locus with multiple alleles, 126 — 5. Joint parent-child distribution, 128 — 6. Conditional distributions of child genotypes when the parent's genotype is given, and vice versa, 133 — 7. Joint grandparent-grandchild genotype distribution, 136 — 8. Ancestral correlation, 138 — 9. Joint parent-child genotype distribution and their correlation for

X-linked genes, 141 — 10. Joint genotype distribution of grandparent and grandchild when the genes are X-linked, 142 — 11. Joint full-sib distributions and their genotypic correlation coefficient, 144 — 12. Interpretation of joint distribution of relatives in large populations, 149 — 13. Snyder's ratios, 149.

Chapter 8. Some Standard Distributions and Their Properties **155**

1. Introduction, 155 — 2. The normal distribution, 156 — 3. The standard normal distribution, 157 — 4. Table of percentage points for normal distribution, 157 — 5. Some distributions related to the normal, 162 — 6. Bernoulli trials, 166 — 7. The binomial distribution, 167 — 8. Proportions of segregating and nonsegregating families for a simple recessive trait, 169 — 9. Distribution of proportions, 173 — 10. The geometric and negative binomial distributions, 174 — 11. The multinomial distribution, 176 — 12. The Poisson distribution, 178 — 13. Population and sample. Sampling from infinite and finite populations, 179 — 14. The distribution of the sample, 182 — 15. Sampling distributions, 184 — 16. Some exact sampling distributions from normal population, 184 — 17. Large-sample theory. The central limit theorem, 186 — 18. Normal approximation to the binomial distribution, 188 — 19. The approximate χ^2-distribution for a function of multinomial variables, 189 — 20. Approximate mean and variance of a function of random variables, 190.

Chapter 9. Inbreeding and Nonrandom Mating **196**

1. Inbreeding. Identities of genes, 196 — 2. Coefficient of inbreeding of an individual. Malécot's definition, 200 — 3. Consanguinity of two individuals. Malécot's coefficient of parentage, 200 — 4. Relations between F and φ, 201 — 5. Wright's formula for evaluation of an inbreeding coefficient in an irregular pedigree, 206 — 6. The X-linked genes, 212 — 7. The structure of a population subject to inbreeding. Wright's definitions of the coefficients of inbreeding and relationship, 213 — 8. Genotypic mean and variance in a population with inbreeding, 216 — 9. Gene frequency of rare recessive traits evaluated from consanguineous marriages, 218 — 10. Regular breeding systems, 219 — 11. Mixture of selfing and random mating in a population, 225 — 12. Inbreeding in randomly mating population of finite size, 227 — 13. Inbreeding in a population divided into isolates. Wahlund's principle, 228 — 14. General remarks on different definitions and applicability of the inbreeding coefficient, 229 — 15. Assortative

mating, 231 — 16. Approach to homozygosity by successive backcrosses, 234.

Chapter 10. Natural Selection and Mutation **240**

1. Mechanisms of selection, 240 — 2. Fitnesses of genotypes, 241 — 3. A single autosomal locus with multiple alleles. Changes in gene frequencies due to selection, 244 — 4. Randomly mating population under selection, 247 — 5. The rate of increase of the mean fitness per generation. Fundamental theorem of natural selection, 248 — ▼ 6. Stable and unstable equilibria, 251 — 7. Single locus with two alleles, 257 — 8. Randomly mating population. Variable fitnesses depending on gene frequencies, 259 — 9. Different fitnesses in the two sexes, 260 — 10. Selection at the X-linked locus, 261 — ▼ 11. Selection at two autosomal loci. Randomly mating population, 265 — 12. Selection and inbreeding, 269 — 13. Distribution of mutants in a population, 272 — 14. Changes in gene frequencies due to mutation, 272 — 15. The probability of extinction of a mutant gene, 274 — 16. Joint effects of mutation and selection, 275.

PART II. EXPERIMENTAL GENETICS. ESTIMATION OF GENETIC PARAMETERS AND TESTING GENETIC HYPOTHESES

Chapter 11. Estimation of Genetic Parameters. General Theory **285**

1. General problem of estimation, 285 — 2. Properties of a "good" estimator, 287 — 3. The maximum likelihood method of estimation. One parameter, 290 — 4. Asymptotic properties of maximum likelihood estimators, 295 — 5. Functions of the ML estimators, 298 — 6. Confidence intervals, 299 — 7. Scores and amount of information, 302 — ▼ 8. Estimation of several parameters by the method of maximum likelihood, 305 — ▼ 9. Confidence regions, 308 — 10. Planning of experiments. Required sample size, 309.

Chapter 12. Estimation of Parameters Associated with Multinomial Distributions **314**

1. Introduction, 314 — 2. Maximum likelihood estimators of multinomial parameters, 314 — 3. The ML estimator of a function of multinomial proportions. Single parameter, 315 — 4. Estimation of gene

frequencies in randomly mating natural populations. General remarks, 317 — 5. ML estimators of gene frequencies from the numbers of genotypes or phenotypes observed in a simple random sample from a population, 318 — 6. Simple random sample from a "truncated" population, 321 — 7. Sampling from one generation when information about parental genotypes is available, 321 — 8. Sampling from two generations, 322 — 9. Sampling from a population of related pairs, 323 — 10. Maximum likelihood scores for samples of mother-child pairs, 324 — 11. Combination of data, 328 — ▼ 12. ML estimators of functions of multinomial proportions. Several parameters, 332 — ▼ 13. Estimation of admixtures in a "hybrid" population, 334 — 14. Minimum chi-square estimators, 338.

Chapter 13. Testing Genetic Hypotheses **345**

1. Genetic and statistical hypotheses, 345 — 2. Statistical test, 346 — 3. The power of the test, 348 — 4. Construction of a significance test for a parametric hypothesis, 353 — 5. Chi-square tests of significance useful in genetics. General remarks, 354 — 6. Approximate significance tests about parameters. Large-sample theory, 355 — 7. Tests of goodness of fit, 357 — 8. Tests of independence (or tests for association), 360 — 9. Test for association and the sample correlation coefficient for A 2×2 contingency table, 362 — 10. Tests of homogeneity (or for heterogeneity). General concepts, 365 — ▼ 11. A general method of homogeneity testing based on large-sample theory, 366 — 12. Tests for heterogeneity about multinomial parameters specified by $H_0^{(a)}$, 370 — 13. Tests for heterogeneity when multinomial proportions are functions of some parameters not specified by $H_0^{(a)}$. Equilibrium and heterogeneity, 371 — ▼ 14. Evaluation of the power of the test. Discrimination between two simple hypotheses, 376 — 15. Sample size when α and β are specified, 380 — ▼ 16. Sequential tests, 380.

Chapter 14. Human Blood Groups **391**

1. Introduction, 391 — 2. Serology of blood groups, 391 — 3. Inheritance of blood antigens, 392 — 4. Genetics of the A_1A_2BO- blood group system and its association with the *H* and *Se* loci, 393 — 5. Estimation of gene frequencies in blood group systems. General remarks, 395 — 6. Bernstein's method of estimating the *ABO* gene frequencies, 396 — 7.The maximum likelihood estimators of the *ABO* gene frequencies, 398 — 8. Gene-counting estimators of the *ABO* gene frequencies, 400 — 9. Efficiency of Bernstein's estimators, 402 — 10. Estimation of

the gene frequencies in the A_1A_2BO blood system, 402 — 11. The Lewis blood group system, 403 — 12. The *P* blood group system, 405 — 13. *The MNSs* blood group system, 405 — 14. Estimation of gene frequencies in the *MNSs* blood system, using anti-M, anti-N, and anti-S reagents, 406 — 15. The Rhesus blood group system, 411 — 16. The Lutheran blood group system and its linkage with the secretor locus, 413 — 17. The X-linked blood group system, 414 — 18. Other blood group systems, 414 — 19. Blood groups and diseases, 414 — 20. Selection at the *ABO* and the *MNSs* loci, 415.

Chapter 15. Autosomal Linkage in Experimental Populations **421**

1. Introduction, 421 — 2. Orthogonal functions of random variables, 421, — 3. Detection of linkage from double backcrosses, 423 — 4. Detection of linkage from intercrosses, 425 — 5. Detection of linkage from triple backcrosses, 427 — 6. Estimation of the strength of linkage, 428 — 7. Disturbance factors in linkage, 431 — 8. Double crossing over, 431 — 9. Interference and the coefficient of coincidence, 432 — 10. Arrangement of loci on a chromosome, 433 — 11. Estimation of the coefficient of coincidence from three-point testcross, 433 — 12. Chromosome mapping, 435.

Chapter 16. Statistically Equivalent Models of Inheritance **439**

1. Identical phenotype distributions under different modes of inheritance, 439 — 2. Incomplete penetrance and expressivity, 440 — 3. Several loci with additive phenotypic effects versus single locus. Equivalent models, 442 — 4. A discriminatory design for models with additive phenotypic effects, 449 — 5. Differential viability, 451 — 6. Simple versus double (or multiple) recessive. Indistinguishable Snyder's ratios, 453.

Chapter 17. Segregation Ratios in Families. Simple Modes of Inheritance **458**

1. Random sampling and family records, 458 — 2. Rare and common genetic traits, 459 — 3. Segregating and nonsegregating families. Ascertainment, 461 — 4. Ascertainment through the affected children. Terminology and definitions, 463 — 5. The distribution of affected children in high-risk segregating families, 466 — 6. Maximum likelihood estimator of the segregation parameter θ under multiple ascertain-

ment ($0 < \pi \leqslant 1$), with known π. Fixed numbers of ascertained families, 468 — 7. Maximum likelihood estimator of θ under complete ascertainment ($\pi = 1$), 472 — 8. Evaluation of scores, amounts of information, and heterogeneity tests, 474 — 9. Approximate Weinberg's sib method, 479 — 10. An approximate method of Li and Mantel for estimating θ, 481 — 11. Efficiencies of the approximate estimators $\tilde{\theta}_s$ and $\bar{\theta}_s$, 482 — 12. Maximum likelihood estimator of θ under single ascertainment ($\pi \to 0$), 484 — 13. Weinberg's "proband method," 486 — 14. Test of goodness of fit under single ascertainment, 486 — 15. The ascertainment probability, π, and its estimation, 487 — 16. The number of families under risk, 490 — 17. Ascertainment through the parents. Recessive trait, 492 — 18. Difficulties in analysis of family data, 492.

▼ **Chapter 18. Complex Segregation Analysis** 497

1. More advanced models for analyzing family data. Advantages and difficulties, 497 — 2. A general model for complex segregation analysis. Random sampling of parents, 498 — 3. Models for complex segregation analysis. Selection through the children, 501 — 4. Likelihood equations and information matrix, 502 — 5. Testing hypotheses, 504 — 6. Estimation of gene frequencies from family data. Separation of nonsegregating and segregating families, 506 — 7. Interaction of loci. Double autosomal recessive, 509 — 8. Complex segregation analysis for multiple classification, 513 — 9. Estimation of gene frequencies and recombination fraction of two linked loci, using family data, 515.

Chapter 19. Histocompatibility Testing 521

1. Immunogenetic mechanism of histocompatibility, 521 — 2. Histocompatibility models. General assumptions, 522 — 3. Some terminology in tissue transplantation, 523 — 4. Immunological unresponsiveness and tolerance, 525 — 5. Types of designs for histocompatibility testing in laboratory animals, 526 — 6. Estimation of the number of histocompatibility loci in laboratory animals. Single, one-way ($D \to R$) grafting designs, 526 — 7. Required sample size, 530 — 8. Grafting among relatives, 531 — 9. Reciprocal grafting designs ($D_1 \rightleftharpoons D_2$), 532 — 10. Double-grafting designs ($D_1 \to R \leftarrow D_2$), 535 — 11. Strength of immune response to transplantation antigens. The H loci in mice, 537 — 12. Some arbitrary measure of strength of histocompatibility alleles (antigens), 539 — 13. A model including strong, weak, and mixed loci

for one-way single-grafting designs, 540 — ▼ 14. A model including strong and weak loci for the double-grafting design $Pt_1 \rightarrow F_2 \leftarrow Pt_2$, 543 — 15. Histocompatibility systems in man. The *HL-A* system, 546 — 16. Histocompatibility models in randomly mating populations, 547 — 17. General remarks, 548.

Appendix I Elements of Matrix Algebra 555

Appendix II Minima and Maxima of Functions. Taylor's Expansions 569
