Preface and acknowledgements	vii
List of tables	xi
1 Introduction	1
1.1 Solution of geological problems – are mathematical methods necessary?	1
1.2 Mathematical formulation of a geological problem	3
1.3 Computational aids	7
1.4 Speed and accuracy	11
1.5 Computer literature	12
2 Useful mathematical ideas	13
2.1 Algebra	13
2.2 Geometry and trigonometry	43
2.3 Probability theory	51
3 Sequences and series	56
3.1 Definitions	56
3.2 Some common series	59
3.3 Geological applications	63
4 Rates of change – differentiation	76
4.1 Functions: some further definitions	76
4.2 Differentiation	78
4.3 Maxima and minima	87
4.4 Optimization and the method of Lagrange multipliers	94
4.5 Differentiation and least-squares methods	96
5 Areas and volumes: integration	105
5.1 Integration	105
5.2 Analytical methods	110
5.3 Volume calculations	115
5.4 Summation, integration and probability distributions	119
5.5 Fourier series and the analysis of sequential data	121

6	Number arrays, the algebra of matrices	129
6.1	Introduction and definitions	129
6.2	Basic matrix operations	133
6.3	Eigenvalues and eigenvectors	149
6.4	Geological applications and examples	157
7	Introduction to numerical methods	176
7.1	The need for numerical methods	176
7.2	Iterative methods for the solution of equations	181
7.3	The solution of simultaneous linear equations	187
7.4	Geological applications	208
8	Geological applications of differential equations	216
8.1	Definitions and examples	216
8.2	Numerical solution: the method of finite differences	219
8.3	Geological applications	226
9	Beyond traditional mathematics	238
9.1	Catastrophe theory	238
9.2	Information theory	246
Appendix 1	An introduction to the methods of differentiation	255
A1.1	The rules of differentiation and their application	255
A1.2	Standard forms and their use	258
A1.3	Implicit differentiation	259
Appendix 2	An introduction to the methods of integration	261
A2.1	The rules of integration	261
A2.2	Standard forms	262
A2.3	Substitution	262
Appendix 3	Computer programs	265
