

Contents

1. SYMMETRY AND THE SOLID STATE	1
1.1. Introduction	1
1.2. Group theory	7
1.3. Group representations	15
1.4. Point groups	24
1.5. Space groups	37
2. SYMMETRY-ADAPTED FUNCTIONS FOR THE POINT GROUPS	51
2.1. The matrix elements of the rotation group	51
2.2. The generation of symmetry-adapted functions	54
2.3. Application to the point groups	56
2.4. Symmetry-adapted functions for the crystallographic point groups	57
2.5. Active and passive operators	76
2.6. Symmetrized and anti-symmetrized products of point-group representations	77
3. SPACE GROUPS	81
3.1. Bravais lattices	81
3.2. Reciprocal lattices and Brillouin zones	86
3.3. The classification of points and lines of symmetry	95
3.4. The irreducible representations of the translation groups	119
3.5. The classification of the 230 3-dimensional space groups	121
3.6. The action of space-group operations on Bloch functions	144
3.7. A descriptive account of the representation theory of space groups	146
3.8. Examples: cubic close-packed and diamond structures	161
4. THE REPRESENTATIONS OF A GROUP IN TERMS OF THE REPRESENTATIONS OF AN INVARIANT SUBGROUP	171
4.1. Induced representations	171
4.2. Groups with an invariant subgroup	176
4.3. The theory of little groups	181
4.4. The small representations of little groups	184
4.5. The point groups as semi-direct products	186
4.6. The reality of representations induced from little groups	201
4.7. Direct products of induced representations	204
4.8. Symmetrized and anti-symmetrized squares of induced representations	215

5. THE SINGLE-VALUED REPRESENTATIONS OF THE 230 SPACE GROUPS	225
5.1. Abstract groups	225
5.2. The single-valued representations of the 230 space groups	285
5.3. The labels of space-group representations	389
5.4. Example of the use of the tables of the space-group representations	397
5.5. Representation domain and basic domain	407
6. THE DOUBLE-VALUED REPRESENTATIONS OF THE 32 POINT GROUPS AND THE 230 SPACE GROUPS	418
6.1. The double-valued representations of the point groups	418
6.2. Symmetry-adapted functions for double point groups	437
6.3. The double-valued representations of the space groups	454
6.4. An example of the deduction of the representations of a double space group	458
6.5. The double-valued representations of the 230 space groups	467
7. THE MAGNETIC GROUPS AND THEIR COREPRESENTATIONS	569
7.1. The Shubnikov groups and their derivation	569
7.2. The classification of Shubnikov groups	570
7.3. Anti-unitary operations and the corepresentations of magnetic groups	605
7.4. The Kronecker products of corepresentations	618
7.5. The corepresentations of the magnetic point groups	622
7.6. The corepresentations of the magnetic space groups	638
7.7. Example: the space-group corepresentations of $P4'_2/mnm'$ and their Kronecker products	652
7.8. Spin-space groups	669
7.9. Polychromatic point groups and space groups	677
APPENDIX	682
